Previous to purchasing the Florence I owned the Howe Sewing Machine.
MRS. J. CRAWFORD,
Copperopolis, Calaveras county, Cal.

I used the Sloat Eliptic Machine six months previous to purchasing the Florence.
MRS. MARY CAFFEY,
Dressmaker, 16 Post street, San Francisco.

We, whose names follow, owned and used the Grover & Baker Sewing Machine previous to purchasing the Florence:

Mrs. Mary A. Merchant, dressmaker, 810 Stockton street, San Francisco.
Mrs. B. Weller, dressmaker, 406 Dupont street, San Francisco.
Mrs. Chas. Uznay, 419 Bryant street, San Francisco.
E. A. Love, Angel's, Calaveras county, California.
Mrs. M. J. Roberts, 646 Howard street, San Francisco.
Mrs. L. H. Bayley, Portsmouth House, San Francisco.
Mrs. Julia Lyons, Target street, near Tehama, San Francisco.
Mrs Harriet Howes, 625 Post street, San Francisco.

We, whose names follow, owned and used the Wheeler & Wilson Sewing Machine previous to purchasing the Florence:

Mrs. J. D. Blain, Hubbard street, near Howard, San Francisco.
Mrs. D. S. Ruggles, 414 Folsom street, San Francisco.
Mrs. M. Young, 211 Stockton street, San Francisco.
A. M. Flint, C. L. Flint, San Juan, Monterey county, Cal.
Mrs. C. P. Jackson, El Dorado, El Dorado county, Cal.
Mrs. C. L. Taylor, 512 Dupont street.
Mrs. Sarah E. Miller, Sacramento.
Mrs. A. Nash, corner Stevenson and Third streets, San Francisco.
Mrs. Thomas Mitchel, Mokelumne Hill, Calaveras county.

The following named persons owned and used the Singer Sewing Machines previous to purchasing the Florence:

Mrs. A. J. Turner, 320 Beale street, San Francisco.
Mrs. H. B. Osborne, 612 Powell street, San Francisco.
Mrs. Annie Dailey, Bush street, below Stockton, San Francisco.
Augustus Brown, 134 Sutter st., San Francisco.
Mrs. F. Scherb, 673 Mission street, San Francisco.
Mrs. Sarah P. Vick, dressmaker and seamstress, 109 Stevenson street, San Francisco.

I have found the Florence to be all that I anticipated. It has never been out of order, nor ever has "spells," like most machines of other manufacture, several of which I have owned. I can conscientiously recommend the "Florence."
Mrs. ALBERT BADER.
San Andreas, May 17, 1864.

The Testimony of all purchasers of the Florence is but a repetition of the opinion of the few whose names are given above.

As our competitors have not deemed it advisable to exhibit their machines at the present Fair, to be tested by the side of *The Florence*, and as there are many strangers in the city, who contemplate purchasing sewing machines, who prefer (and we earnestly request them to do so) to see and compare the merits of all before they make their selection, we give below, for their convenience, the location of the principal Sewing Machine Offices in the city.

LOCK STITCH MACHINES.

Wheeler & Wilson's, office, corner Montgomery and Sacramento streets.
Singer's, 139 Montgomery street.
Ladd & Webster's, 32 Montgomery street.
Howe's, 3 Montgomery street.
Williams & Orvis', corner Jackson and Battery streets.

CHAIN, LOOP, AND "EMBROIDERY" STITCH MACHINES.

Grover & Baker's, office, 329 Montgomery st.
Folsom's New England, 8 Montgomery street.
Little Giant, 3 Montgomery street.

Parties who have not had the opportunity to thoroughly examine the Florence at the Pavilion, owing to the crowd of people gathered around the machines, will please call at Sales Room 111 Montgomery street and test them at their leisure, and until perfectly satisfied whether what is claimed for them is true or not.

SAMUEL HILL,
General Agent for the Sale of the Florence on the Pacific Coast.

MRS. C. M. CHAPMAN'S

Celebrated Vegetable Hair Dye.

THIS Coloring for the Hair is guaranteed to effect its object in the most perfect manner, without injury. Being composed of a vegetable Seed, it has a tendency to promote its GROWTH and STRENGTH.

It contains no mineral substance as other Dyes. Batchelor's and all other Dyes known are composed of, or from, Nitrate of Silver. This has no such substance. Specimens of Ladies' Hair colored can be shown to the satisfaction of any one. No. 687 Market Street. 10v9-1df

ASTROLOGER.

GO and see the Natural Gifted Astrologer, PROF. COHEN, 630 California street. He can give you true information as to the Past, Present and Future on Business Affairs, Law Suits, Matrimony, Love, Absent Friends, Sickness, etc. He tells the events of your whole life, and how to avoid trouble. A large number of people have been benefitted by his knowledge. As an evidence of his reputation he has received upwards of 15,000 consultations here in San Francisco.

N. B.—When personal consultation is had it will not be necessary to give the age. Office hours, 8 to 12 M., and from 2 to 9 P. M. Consultation, $2; by letter, $3 with Chart. Sickness will be discovered and cured through science only known by him. 1-df

OUR ADVERTISERS.

We would call the especial attention of persons visiting the city during the continuance of the Fair, to the advertising columns of the MECHANICS' FAIR DAILY PRESS. Strangers will find these columns a sure and safe guide in making their purchases. Almost, or quite, every department of trade and business will be found there represented; and it may be set down as a pretty safe rule that those merchants and business men who have availed themselves of this opportunity to spread their business before the thousands of strangers who are now visiting the city, will be found the most liberal in their dealings of any of our traders. The liberality and good judgment which has secured for them a place in these columns, will not be found wanting in ordinary dealings with their customers. We trust our lady and gentlemen friends, under whose notice these lines may fall, will look over our columns carefully and make therefrom a selection of the business firms with whom they may have occasion to deal. In future numbers we shall take occasion to call particular attention to each of our advertisers in turn.

Our Patent Agency.

The PATENT AGENCY of the MINING AND SCIENTIFIC PRESS has been signalized with remarkable success during the past two years. The importance to the inventive genius of the coast of a thorough and reliable agency for the solicitation of LETTERS PATENT from the United States and foreign governments cannot be over-rated, and the Proprietors of the PRESS, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and and responsible agency upon this coast.

TWELFTH YEAR OF PUBLICATION.

THE GOLDEN ERA,

Founded in 1852.

The oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent, and correspondents of distinguished ability in New York, Paris and London.

THE GOLDEN ERA is now enlarged by the addition of eight columns to its pages—and presents fifty-six columns containing the greatest possible variety of Valuable and Entertaining, Original and Selected Matter, all combining to render THE GOLDEN ERA a Literary and Family Journal of surpassing interest and attraction; a Welcome Guest in Cottage and Cabin; the favorite at the fireside in City and Country, the most useful, agreeable altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe, and elsewhere. Every Household in the Mountains and Valleys, the Cities, Towns, and Mining Camps of California and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor.

"THE DOCTOR'S WIFE," now in course of publication in London, is universally pronounced to be Miss Braddon's greatest production. It will be completed in sixteen numbers of THE GOLDEN ERA.

Mining and Scientific Press Patent Agency.

SAN FRANCISCO.

Information About Obtaining Patents.

The Patent Law Amendment Act, of March 4th, 1861, and March 3d, 1863, now in force, introduces several important changes in our Patent System. The general practice of the Patent Office, however, in regard to the examination and issue of Letters Patent for new inventions, remains nearly the same as heretofore.

The amendment of 3d March, 1863, provides, in section 3, that every patent shall be dated as of a day not later than six months after the time at which it was passed and allowed, and notice thereof sent to the applicant or his agent. And if the final fee for such patent be not paid within the said six months, the patent shall be withheld, and the invention therein described shall become public property as against the applicant therefor: *Provided*, That in all cases where patents have been allowed previous to the passage of this act, the said six months shall be reckoned from the date of such passage.

The first question, therefore, that presents itself to the inventor, who desires to procure a patent, is: "Can I obtain a patent?" A positive answer to this question is only to be had by presenting a formal application for a patent to the Government, embracing a petition, specification, model, duplicate, drawings, and the payment of the prescribed official fees. Aside from these steps, all the inventor can do is, to submit his plans to persons experienced in the business of obtaining patents, and solicit their opinion and advice. If the parties consulted are honorable men, the inventor may safely confide his ideas to them, and they will inform him whether or not his invention is probably patentable.

Those who have made inventions and desire to consult with us respecting the same, are cordially invited to do so. We shall be happy to see them in person at our office, or to advise them by mail, or through the MINING AND SCIENTIFIC PRESS. In all cases they may expect from us an honest opinion. For these consultations, opinion and advice, we make no charge. A pen-and-ink sketch, and description of the invention should be sent, together with a stamp for return postage. Write plain; do not use pencil or pale ink; be brief.

Remember that all business committed to our care, and all consultations, are kept by us secret, and strictly confidential.

Preliminary Examinations.

In some cases it may be advisable as a measure of prudence to order a preliminary examination. This consists of a special search made at the U. S. Patent Office, Washington, through the medium of our associate in that city, to ascertain whether among all the patents and models there stored any invention can be found which is similar in character to that of the applicant. On the completion of this special search we send a written report to the party concerned, with suitable advice. Our charge for this service, including the report, is ten dollars. This search, though it involves the expense just named, will usually prove satisfactory. If the same device has been before patented, the time and expense of constructing models, preparing documents, etc., will in most cases be saved; if the invention has been in part patented, the applicant will be enable to modify his claims and expectations accordingly. Many other obvious advantages attending the Preliminary Examination; although the strictest search does not always enable the applicant to know positively whether a patent can be had. Applications for patents are often rejected because the Examining officer finds a description of the alleged invention in some foreign publication; or some other person has been previously rejected on an analagous device; or some other invention for a similar purpose, but partially resembles the applicant's in its construction; or the Government makes an unjust or uncommon decision. Against none of these contingencies does the Preliminary Examination provide; it will, however, generally inform the applicant whether an improvement similar to his and used for the same purpose has ever been patented or not in this country.

Persons desiring the Preliminary examination are requested to remit the fee ($10), and furnish us with a sketch and description of the invention.

Caveats.

A Caveat is a confidential communication made to the Patent Office, and is therefore filed within its secret archives. The privilege secured under a caveat is, that it entitles the caveator to receive notice, for a period of one year, of any application for a patent subsequently filed, and which is adjudged to be novel, and is likely to interfere with the invention described in the caveat, and the caveator is then required to complete his application for a patent within three months from the date of said notice. Caveat papers should be very carefully prepared. Our fee for the service varies from $10 to $20. The Government fee under the new law is reduced to ten dollars; and this sum does not apply, as heretofore, as part of the fee on presenting an application for a patent.

Inventors will oftimes find it very important to take advantage of the caveat system—the expense under the law being comparatively small.

To enable us to prepare caveat paper, we only require a sketch and description of the invention; no model being necessary.

Expense of Applying for a Patent, Rejections, etc.

Under the new law, the Government fee, on filing an application for a patent, is fifteen dollars; and if the patent is allowed, twenty dollars additional is required. If rejected, the first fee of fifteen dollars is all that is demanded. English, French, Austrian, Prussian Spanish, and inventors of every nationality, may now obtain patents in the United States upon the same terms as our own citizens. The only discrimination made is against subjects or government that discriminate against the inhabitants of the United States.

To the foregoing official fee must be added the Attorney's fees for preparing the various documents and drawings. Our charge for preparing a case, presenting it to the Government, and attending to all business connected with it, until a decision is given, is from $20 to $40. If the patent is granted no further agency expenses ensues. If the application is rejected we cause a thorough investigation to be made into the reasons presented to the Commissioner for refusing the patent. In making this examination, we have access to all the drawings, models, books and specifications cited in reference, and we report to you as early as possible to our client. For this service we make no charge. If the rejection proves to be an unjust one—which sometimes happens—it can generally be reversed, and the patent obtained by contesting like case. For this prosecution we charge a fee proportionate to the extra labor involved, payable only on the issue of the patent; but our demand will be reasonable and satisfactory to our clients, and will be arranged beforehand by special agreement.

The system adopted by us works well, gives general satisfaction and presents to all applicants, rich or poor, an equal opportunity of having their patent cases prepared, conducted and prosecuted in the best manner, by experienced attorney's, upon the most moderate terms. Inventors who have rejected cases, prepared either by themselves, or for them by other agents, and desire to ascertain their prospects of success by further efforts, are invited to avail themselves of our unequalled facilities in securing favorable results. We have been successful in securing Letters Patent in many cases of such a matter. Our terms for such cases are very moderate.

Models, Remittances, etc.

The law requires that the inventor shall, in all cases, furnish a model, which must not exceed twelve inches in any of its dimensions; it should be neatly made, of wood, iron or metal, or both, varnished or painted; the name of the inventor should be engraved or painted on it conspicuously.

When the invention consists of an improvement on some known machine, a full working model of the whole will not be necessary. It should be sufficiently perfect, however, to show, with clearness, the nature and operation of the invention.

As soon as the model is ready, it should be carefully boxed and shipped by express or otherwise, to our address, namely: DEWEY & Co., Mining and Scientific Press, rooms 56 and 57, Government House, corner of Sansome and Washington Streets, San Francisco, Cal. Prepay expenses and send express receipt to us by mail.

Simultaneously with the model, the inventor should send us the first installment of the Government fee, fifteen dollars. The money may be forwarded either by express with the model, or by mail. The safest way to remit is by draft on San Francisco, payable to our order. Always send a letter with the model, and also the remittance stating the name and address of the sender.

A full description should also be sent with the model, embodying all the ideas of the inventor respecting the improvement.

On the receipt of the model and Government fee, the case is duly registered upon our books, and the application proceeded with as fast as possible. When the documents are ready we send them to the inventor by mail, for his examination, signature and affidavit, with a letter of instruction, etc. Our fee for preparing the case is then due and will be called for. The case will then be presented to the Patent Office, and as soon as the patent is ordered to be issued the Government fee, namely, twenty dollars.

Inventors who do business with us will be notified of the state of their application in the Patent Office, when it is possible for us to do so. We do not require the personal attendance of the inventor, unless it is one of great complication the business can be well done by correspondence.

When the invention consists of a new article of manufacture, or a new composition, samples of the separate ingredients, sufficient to make the experiment, and also of the manufactured article itself must be furnished.

The average time required to procure a patent, when the case is conducted at our agency, is three months. We frequently get them through in less time; but in other cases, owing to delay on the part of officials, the period is sometimes extended to four or five months, and even more. We make a special point to forward our cases as rapidly as possible.

Return of Models.

Under the new law, if the applicant's case has been rejected he is entitled to withdraw his model from the Patent Office.

This law applies to all past rejected cases, and if parties wish to obtain their models through us, they can do so at a small expense.

Application for Patents, Designs, Trade-Marks, Labels, etc.

Under the new law patents may be taken out for any new form of any article, also for tools, patterns, castings, machine-frames, stove-plates, borders, fringes, all new designs for printing, weaving or stamping upon silks, calicoes, carpets, oil-cloth, prints, paper-hangings, and other articles. Trade-marks, labels, envelopes, boxes and bottles for goods, may also be patented; likewise all works of art, including prints, paintings, busts, statues, bas-relief, or compositions in alto, or basso relievo, new dies, impressions, ornaments to be placed upon any article of manufacture, architectural work, etc.

Our facilities for the prompt preparation and securing of patents are of the most thorough character and our charges are very moderate.

Patent Office Fees, and How Payable.

Nearly all the fees payable to the Patent Office are positively required by law to be paid in advance. For the sake of uniformity and convenience, the remaining fees will be required to be paid in the same manner; that is to say, before the labor is performed for which they are to be received in payment.

The following is the tariff of fees established by law:

On every application for a design, for 3 yrs and 6 mos...	$10
On every application for a design, for seven years.....	15
On every application for a design, for fourteen years.....	30
On every caveat.....	10
On every application for a patent.....	15
On issuing each original patent.....	20
On filing a disclaimer.....	10
On every application for a re-issue.....	30
On every additional patent granted on a re-issue.....	30
On every application for an extension.....	50
On the grant of every extension.....	50
On appeal to the Commissioner from Examiners-in-chief	20
On every appeal to the Judges of Circuit Court, D. C....	25

Infringements.

The manufacture, sale, or use of a patented article, without consent of the owner of the patent, is an infringement, and subjects the infringer, by injunction from the Court, to an arrest of or prohibition from the employment of his machinery, shop, works, factory and men in production of the article.

In addition to injunction the infringer is liable to be mulcted in treble the amount of damages awarded by the jury. The maker, the workman, the seller, and the purchaser, if a user, are all liable either collectively or individually.

Having access to all the patents, models, public records, drawings and other documents pertaining to the Patent Office, we are prepared to make examinations and give opinions upon all infringement questions, advise as to the scope and ground covered by patents, and direct when or how any legal proceedings therewith connected. Our charge will be moderate, and proportionate to the labor involved.

Appeals.

In rejected and other cases, the new law provides for an appeal from the Examiner-in-chief to the Commissioner in person, on the payment of a fee of twenty dollars. A further appeal may be taken from the decision of the Commissioner to the U. S. Court of the District of Columbia. These appeals are heard by any of the Judges before whom the applicant elects to bring the case. No Jury. All the papers, models, etc., are sent by the Commissioner to the Judge, who then reviews the case, and either sustains or reverses the Commissioner's decision.

The party taking the appeal pays an additional fee of twenty-five dollars. The Judge appoints a day of hearing. The applicant can appear in person or by counsel to state his case and file a written argument. Five days are allowed the opponent to put in an answer, and a similar period to the appellant for a closing reply.

Many important cases are brought before the Judges on appeal and the decisions of the Commissioner are not unfrequently reversed.

We have had successful experience in conducting these appeals and our services are rendered on moderate terms.

Putnam's Clothes Wringer.

IT IS THE ONLY RELIABLE SELF-ADJUSTING WRINGer. No wood work to swell or split. No thumb-screws to get out of order. Warranted with or without cog-wheels. It took the FIRST PREMIUM at Fifty-Seven State and County Fairs in 1863, and is WITHOUT AN EXCEPTION the best Wringer ever made. Patented in the United States, England, Canada and Australia. Agents wanted in every town, and in all parts of the world. Energetic agents can make from three to ten dollars per day. Sample Wringer sent Express-paid on receipt of price. No. 2, $5.50. No. 1. $7.50. No. F. $8.50. No. A. $9.50. Manufactured and sold wholesale and retail, by

THE PUTNAM MANUFACTURING CO.,

No 13 Platt Street, New York, Cleveland, Ohio and Bennington, Vt. S. C. NORTHROP, Agent.

What Everybody Knows,

Viz: That Iron well galvanized WILL NOT RUST; That a simple machine is better than a complicated one; That a Wringer should be self-adjusting, durable and efficient; That Thumb-Screws and Fastenings cause delay and trouble to regulate and keep in order; That wood soaked in hot water will swell, shrink and split; That wood bearings for the shaft to run in will wear out; That the Putnam Wringer, with or without cog-wheels, will not tear the clothes; That cog-wheel regulators are not essential; That the Putnam Wringer has ALL the advantages, and not one of the disadvantages above named; That all who have tested it, pronounce it the best Wringer ever made; That it will wring a Thread or a Bed-Quilt without alteration.

We might fill the paper with testimonials, but insert only a few to convince the skeptical, if such there be; and we say to all, TEST Putnam's Wringer. Test it THOROUGHLY with any and all others, and if not entirely satisfactory, return it.

Putnam Manufacturing Co:—

GENTLEMEN. I know from practical experience that iron well galvanized with zinc will not oxydize or rust one particle. The Putnam Wringer is as near perfect as possible, and I can cheerfully recommend it to be the best in use. Respectfully yours,

JNO. W. WHEELER, Cleveland, Ohio.

Many years experience in the galvanizing business enables me to endorse the above statements in all particulars.

New York, Jan., 1864. JNO. C. LEFFERTS.
No. 100 Beekman St.

We have tested Putnam's Clothes Wringer by practical working, and know that it will do. It is cheap; it is simple; it requires no room, whether at work or at rest; a child can operate it. It does its duty thoroughly; it saves time and it saves wear and tear. We earnestly advise all who have much washing to do, with all intelligent persons who have any, to buy this Wringer. It will pay for itself in a year at most. HON. HORACE GREELEY.

COLDS AND COUGHS CURED.—The poor man's riches, the rich man's blessing, is health, which is secured by the use of Brandreth's Pills. The wise use is when we are in pain or sick—say in doses of four or five every day or two, until we are well. These pills are not only good for the body, but for the mind; they cure restlessness, impatience, and irritability of temper, and no medicine can be compared to them for the cure of coughs and colds. Sold by all druggists.

THERE is nothing equal, in the way of a plaster, to the Porous Plaster of Mr. ALLCOCK. Everything is pleasant about them. They are the plaster of the day, and a fit type of our present advancement in science and art. In Asthma, Cough, Kidney Affections, and local deep-seated pains, they afford permanent relief.

J. F. JOHNSON, M. D., on "Topical Remedies."

Sold by all druggists.

By order of the Board of Trustees.

JOHN J. SCOTCHLER, Secretary
Office, 204 Front Street. San Francisco, Cal., Sept. 8, 1864
11-5t

Important to Californians.—Many inventors have lately had their claims for Patents seriously (and in some cases fatally) delayed by the unqualification of agents who have not complied with the Government license and revenue laws, as well as other new and imperative regulations. These discrepancies, although arising from the inexperience of honest agents, are none the less dangerous to applicant, for patents, whose safest course is to trust their business with none but active and experienced solicitors. THE MINING AND SCIENTIFIC PRESS PATENT AGENCY has strictly complied with the requisitions of the Department, and properly filed all necessary papers as Claim Agents.

Evoca Consolidated Copper Mining Company, Court Hill or Evoca District, near Black's Ferry, Del Norte County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 5th day of September, 1864, an assessment of 25 cents per share was levied upon the assessable capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, No. 537 Washington street, City and County of San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the 8th day of October, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on the 24th day of October, 1864, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees. CHARLES E. ABBOT, Secretary.

Office, 537 Washington street. San Francisco, California, September 10, 1864. 11-4t

Office, No. 708 Montgomery street, San Francisco. [11-4t

Scottie Gold and Silver Mining Company, La Paz Mining District, Arizona Territory.

The Annual Meeting of the stockholders of this company will be held at the Company's office, No. 523 Clay street, San Francisco, on Tuesday, September 27th, 1864, for the election of Trustees, and the transaction of such other business as may properly come before it.

10-4t B. W. MUDGE, Secretary.

Worth Considering.—Advertising has proved the medium of success to many of the most prominent business men of the world. Merchants, Inventors, Builders, Patentees, Manufacturers, Foundrymen, Machinists, and, in fact, all who wish to call the particular attention of the Mining, Professional, Mechanical and Industrial members of the community to their business, should not fail to advertise in the Mining and Scientific Press. The circulation of the paper is extensive, and has a wide range, reaching the most intelligent readers in every mining settlement of importance on the coast. A large number of copies are also sent East. Our terms are reasonable. "Live and help live" we believe to be a sensible motto.

Santa Cruz Petroleum Oil Works Company— Located in Santa Cruz County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 22d day of August, 1864, an assessment (No. 8) of twelve and a half (12½) cents per share was levied upon the capital stock of said company payable immediately, to the Secretary at his office, No. 338 Montgomery street, San Francisco, in United States gold coin.

Any stock upon which said assessment shall remain unpaid on the 26th day of September, 1864, will be advertised as delinquent, and unless payment shall be made before, will be sold on the 10th day of October, 1864, to pay the delinquent assessment, together with costs of advertising and expenses of the sale.

J. A. RAWSON, Secretary.

Office, No. 338 Montgomery street, August 24, 1864. [9-4t

St. Paul Gold and Silver Mining Company, Amador District, Lander County N. T.

And in accordance with law, and an order of the Board of Trustees, made on the 23d day of August, 1864, so many shares of each parcel of said Stock as may be necessary, will be sold at the auction room of Jerome Rice & Co., No. 327 Montgomery street, (now Maurice Dore & Co.) San Francisco, on the 8th day of October, 1864, at the hour of 12 o'clock. M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale.

C. W. HAYDEN, Secretary.

Office, No. 625 Clay street, San Francisco. 13

Simpson & Bosselle Mining Company—Mines Located in Carson Valley Mining District

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 19th day of September, 1864, an Assessment of 30 cents per share was levied upon the Capital Stock of said Company, payable on the 26th day of September, 1864, in United States gold coin, to the Secretary, at his office, or to DR. J. W. WATKINS, at Markleeville, Alpine County, California.

Any Stock upon which said assessment shall remain unpaid on Saturday, the 22d day of October, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Monday, the 7th day of November, 1864, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees

T. L. BIBBINS, Secretary.

Office, No. 302 Montgomery street, San Francisco. [13-4t

La Candelaria Mining Company, San Dimas, State of Durango, Mexico.

NOTICE.—There are delinquent, upon the following described stock on account of assessment levied on the 23d day of August, 1864, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
J C Beldeman	54	25	$62 50
Charles J Mosely	16	25	62 50
Wm C Root	48	25	62 50

And in accordance with law and an order of the Board of Trustees, made on the 23d day of August, 1864, so many shares of each parcel of said stock as may be necessary, will be sold, at the office of the company, No. 623 Montgomery street, San Francisco; on the 8th day of October, 1864, at the hour of 12 o'clock, M., of said day, to pay said delinquent Assessment thereon, together with costs of advertising and expenses of sale.

GEORGE A. HILL, Secretary.

Office, No. 623 Montgomery street, San Francisco, California. 13

Seneca, Sotoyome and Lily of the West, Gold and Silver Mining Companies, Esmeralda Mining District.

NOTICE.—There are delinquent upon the following described stock, on account of assessments levied on the 10th day of August, 1864, the several amounts set opposite the names of the respective shareholders, as follows:

"SENECA" GOLD & SILVER MINING COMPANY.

VULCAN IRON WORKS CO.,

[ESTABLISHED 1850.]

No. 137 and 139 First Street.

IRON FOUNDERS, STEAM BOILER MAKERS AND

STEAM ENGINE BUILDERS.

THE Machine Shop possesses the greatest number and the largest dimentions of Tools in the State. They have Laths to turn nine feet in diameter and thirty feet long. Their other facilities for executing work rapidly and efficiently are unsurpassed. Upwards of 300 STEAM ENGINES, made at their own Works, are now running in this State and Oregon, in Steamboats, Quartz Mills, Saw and Flouring Mills. Their BOILER WORKS have turned out upwards of 600 STEAM BOILERS of all kinds.

MACHINERY

Quartz Mills, Flour Mills, Hydraulic and other Presses, Hoisting Machines, Gearing Pullies, Gudgeons, Boxes, Hangers, etc., in Great Variety.

Quartz Stampers, Shoes & Dies,

Warranted to be made of the very hardest and toughest Iron.

RAILROAD MACHINERY, LOCOMOTIVE, CARS, CHILLED WHEELS AND TIRES, ETC.

A Published list of the Patterns of these Works will be sent on application.

MANUFACTURERS OF

JONVAL'S TURBINE WATER WHEELS,

The Cheapest, most Perfable and Effective Machine ever Invented for the application of Water as a Motive power. These Wheels are made entirely of Iron, simple, and not liable to get out of order.

☞ A DIPLOMA was awarded to this Company for the *Best* California-Made *Steam Engine*, by the Mechanics' Institute, September, 1857. 13

A MAGNIFICENT

LITHOGRAPHIC VIEW

OF THE

Mechanics' Fair Pavilion.

PUBLISHED AND SOLD BY

DEWEY & CO.,

GEORGE H. BAKER, Artist,

At the office of the "Mechanics' Fair Daily Press," entrance nave of the Pavilion, and at the office of the Mining and Scientific Press, corner of Washington & Sansome streets.

☞ *READ WHAT OTHERS SAY OF IT.* ☜

MECHANICS' FAIR PAVILION.—We have received from Dewey & Co., Patent Agents and publishers of the SCIENTIFIC PRESS, Government House, corner of Washington and Sansome streets, a finely executed lithographic view of the Mechanics' Industrial Fair Pavilion, on Union Square. The picture is mathematically correct in proportion, and will be valuable hereafter as a souvenir of the greatest industrial exhibition ever held in our city.—"Daily Alta."

We are indebted to the publishers of the MINING AND SCIENTIFIC PRESS for a copy of a very excellent engraving they have issued of the Fair building and the Fair grounds. —CALIFORNIAN.

LITHOGRAPHED.—The Mechanics' Fair building has been pictured in good style, by George H. Baker. We acknowledge the receipt of a copy. DEWEY & Co. are the publishers.—CALL.

VIEW OF THE MECHANICS' INSTITUTE PAVILION.—MESSRS. DEWEY & Co. have published a lithographic view of this building. Size, 12 by 19 inches. The workmanship does credit to Geo. H. Baker, the Lithographer. The dimensions of the Pavilion are 375 feet in length, breadth 220 feet; dome 108 feet high and 100 feet diameter, the area being 55,000 square feet. P. J. O'Connor Esq., is the Architect. We hope the sheet will prove highly remunerative.—ARGUS.

THE *Mining and Scientific Press* makes its appearance upon an enlarged sheet. The *Press* is by far the best scientific paper ever published on the Pacific coast. Its contents exhibit both industry and ability. We wish it continued success.—*Washoe Herald.*

SCIENTIFIC AND MINING JOURNAL.—This is as valuable a publication as is produced on the Pacific Coast, and one which interests all parties. It contains much that is instructive and entertaining, and seems to have the right men at the head of its affairs.—*Spirit of the Times.*

The Daily Evening Express, at Victoria, Vancouver Island is published by Messrs. Wallace, Allen & Hardyngo. Terms of subscription: One year, by mail, $10; six months, $6. It contains the late Mining, Commercial, and General News, up to the hour of going to press. Being the ONLY EVENING PAPER published in Victoria, and having a circulation equal to any other Journal in the Colony, it will be found an excellent medium to enable advertisers to bring their notices before the Public. W. H. TOBEY, Agent, Government House, San Francisco. 15-tf

HOME FINANCES.

The condition of the money market is in no material respect different from that of last week. Some parties complain that they are unable to obtain as large a discount line with the Bank as circumstances would seem to warrant, but on the other hand we hear of many instances where money is offered to well known houses for regular legitimate business purposes, and declined for the reason that it is not wanted There is no appearance of pressure from most quarters and capital is as abundant as at any previous period during the year. Some loans upon first class city property have been made this week at 1¼@1½ ₱ cent. per month. These negotiations are entered into with less reluctance than for some time past and we think there is now plenty of money to be had upon such descriptions of security, at the rates named if the borrower is favorably known. Some little distrust still prevails in making long loans to those who do not stand well as men of character and probity in their business relations with the public.

Good Stock collaterals are in more favor with capitalists and money can be obtained from some of the Bankers upon the best and most stable shares at 1½ ₱ cent. per month.

Outside loans take as wide a range as ever and are governed solely by the character of the security offered; rates vary from 2 to 3 ₱ cent. per month.

Receipts of Treasure from the country since last Saturday exceed one million dollars, chiefly in Bullion.

Little or nothing has been done as yet in Eastern Exchange for to-day's steamer. The unsettled condition of the gold market at the East renders it difficult to fix a rate for Bills payable in currency—quotations are likely to range from 80 to 90 premium on gold. Telegraphic transfers are current at 5½ and drafts payable in coin at 3½ ₱ cent. premium.

Legal Tender Notes have been a prominent feature of the market during the week and some $400,000 have been dealt in at from 49 to 54 cents and closing in less demand at lower figures.

Reply to "Pundit."

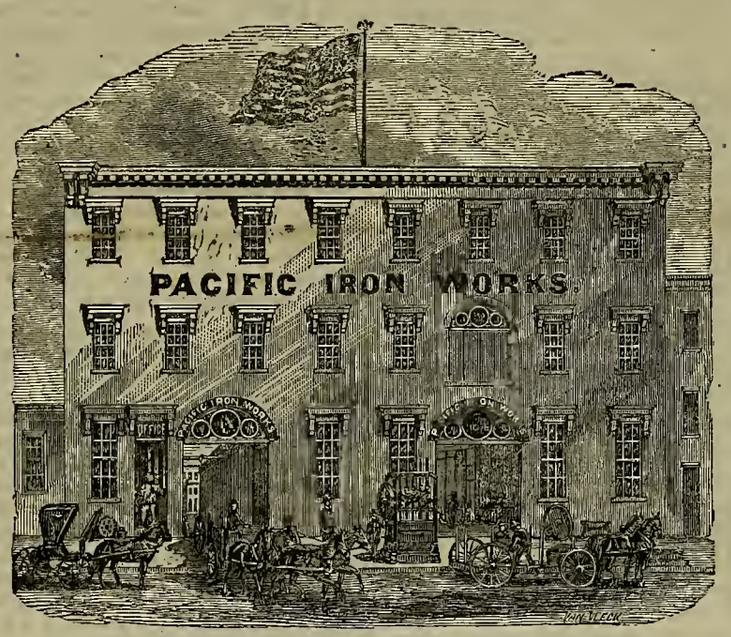
Editors Scientific Press:—Your correspondent "Pundit" persists in retaining his *nom de plume*. If he is satisfied, I am. I shall not enter into any discussion with him, although I would be much pleased to do so on equal grounds, and I flatter myself that he would be much benefitted thereby.

I owe him an explanation on one point, and then I have done. Much of his powder has been wasted by a typographical blunder in the first article, which escaped my observation for a fortnight after publication.

In describing the Primitive Rocks, the period closing the paragraph should have been put immediately after the word "rocks," and the words "or traps." which were written "of traps," should, as is selfevident, have commenced the paragraph following—thus, "Of traps, we have" etc.; for, as printed, it evidently confounds two distinct classes of rocks, and has innocently misled him. O. W. Easton.

THE PACIFIC IRON WORKS.

The most important branch of the manufacturing industry of this city, at the present time, is our Iron Foundries. No city in the Union has made such rapid strides in this branch of industry as San Francisco. Commencing from the smallest beginnings, only fourteen years ago, several of our foundries are now each consuming fully a hundred tons of pig iron per month, in addition to a proportional quantitiy of wrought iron, worked and forged into various descriptions of machinery. The peculiar necessities of our leading industry drove us into this heavy branch of manufacture at an early day and compelled us to consign the hundreds and thousands of tons of worthless machinery shipped to this city in the early days of its history, once more to the grasp of old Vulcan, to be re-forged and reformed into those more suitable shapes, which our experience early taught us were the only ones which could succeed when fairly applied to practice. It was under this extraordinary stimulus that the business was first started, and it was that which gave it such an impulse that we are now able to cope successfully with any part of the world in this speciality.



As early as the summer of 1851, we visited this city for the purpose of obtaining machinery to place upon a quartz-lead near the city of Nevada. We carefully examined a large lot of material sent out from the East by the company with which we were connected, for the purpose of putting into a quartz mill. Like the great mass of machinery so sent, we found it to be worthless, condemned it at once, and repaired to a little one story wooden building on First street, near Mission, where Messrs. Egerly & Hinckley had recently started a "foundry." The entire space occupied by the concern, building, yard and all, was hardly 100 feet square. The foundries were all asking twenty-five cents per pound for castings. By the exercise of a little persuasion we induced the proprietors to close a large contract for 18¾ cents. The institution was a most primitive affair, and the waters of the Bay came quite up to the rear of the premises.

That little establishment was the origin of the magnificent business which has since grown up to what is now known as the "Pacific Iron Works," occupying the whole of four fifty-vara lots, presenting the magnificent frontage represented in the annexed engraving, and extending back the entire block, to Fremont street, giving constant employment to from 150 to 175 hands, requiring for its monthly consumption fully 100 tons of pig-iron, in addition to the proportionate quantity of rolled and bar iron. The history of this is but the counterpart of that of five or six other foundries which were successfully established, and all in this part of the city.

It is mainly to such establishments as this that California is to-day indebted for the proud position she occupies in the great sisterhood of American States, and for her ability to erect in our midst the proud Temple of Industry, which for the past month, has been attracting thousands of pilgrims from all parts of the Pacific Coast, who come to pay a loftier tribute than any which the once proud shrine of Mecca ever drew from her votaries, even during her palmiest days.

This establishment is well known as one of the Pioneer foundry of the State, having been established in 1849. It has been the nucleus around which have clustered numerous similar establishments, and it is thus all the more fitting that from this great central source should emenate that splendid specimen of mechanical genius, which to-day is employed as the central motive power of the Pavilion, and around which, as the life giving influence, has clustered for the past month, the large and varied display of California made machinery, which the genius and enterprise of her mechanics have called into being during the last four years. One such manufactory as this does more toward enriching and building up a State, than a thousand mere traders can do, whose only business it is to serve as brokers between the manufacturer or producer and the consumer. It is to the mechanics of a country that a people is mainly indebted for its prosperity. It is to that class of the community to which we must look almost exclusively for the creation of all values. It is well then that they should have their Temples—better, though, that we should rear one of enduring marble, than of the perishable materials which to-day enshrines the results of their genius and labor.

But we are wandering from our subject. In December 1853, Messrs. Goddard & Co., purchased the interest of the original owners of this foundry, and erected a three story frame building 30x60 feet, and greatly increased the capacity of the establishment by the addition of machinery. In December 1858, another addition was made of a brick building, in the rear, in which was located the cupolas for melting. Soon after the fire which last winter destroyed a portion of the Vulcan Works, adjoining, Messrs. Goddard & Co., commenced to make additional improvements, in the midst of which Mr. Goddard, the head of the firm, was suddenly called by the Great Master above to leave the active scenes below and enter upon those for which his great goodness and large experience here, would seem to have so eminently fitted him. Since that event the improvements have gone on until the establishment is now one of the most perfect, complete and best managed of any one on the Coast. The business is still conducted under the name of the old firm.

The daily running expenses of the establishment reach about $2,000; the machinery is driven by an 80 horse-power engine. The melting capacity of the largest cupola is ten tons, there are two others, the aggregate capacity of which is ten tons, making a total of twenty. This firm has recently turned out some very heavy castings for the San Francisco Water Works, an extensive hoisting apparatus for the Hale & Norcross Company of Washoe, also a large amount of heavy work for several other leading mining companies in Nevada Territory. They are now manufacturing a large number of Varney's Amalgamating Pans, sixteen of which they have recently sent to the New York and Washoe Mining Company. They also manufacture Wheeler's pans, the Bryan Quartz Batteries, and a great variety of other machinery. They are now constructing at their boiler shop three large tubular boilers for Tubbs & Co's Rope Walk at the Potrero.

The present company is managed by Irn P. Rankin, as general Agent, A. P. Brayton, Jr. as cashier and financial manager, and A. C. Austin, formerly of the Vulcan Iron Works, as mechanical manager, who has the entire control of that department.

Unavoidable.—During the Fair we have been obliged to issue our weekly editions Saturday evening. Hereafter our friends will have their papers in good season.

The Mechanics' Fair.

From The Daily Fair Press of September 26th.]

AN INTERESTING TRIAL.

On to-morrow (Tuesday) there will be a trial at the Mechanics' Fair, between Farrand's and Varney's Amalgamators, which promises to be of infinite interest and importance to miners and those interested in mines. These two inventions are so different in form and operation, Varney's being the well known pan with revolving mullers, while Farraud's is an oscillating sort of barrel, with mullers that grind from side to side, so that the two present no similarity except that they are made for the same purpose—we have not learned whether there has been any bets made on the issue, and are inclined to believe that both the gentlemen interested are induced by a much nobler impulse in this trial than the winning of a few dollars. Each absolutely believing his machine the best, enters the list to give the world an opportunity of judging. We are informed, though not by authority, that the trial will include all the amalgamators at the Fair, and will be under the superintendence of the Committee on Mining Machinery.

It appears to us to be somewhat difficult in such a trial to thoroughly test the real merits of these pans, unless as to their grinding capabilities, because, the amalgamating process depends as much or more on the skill and experience of the operator as upon the machine itself. Nevertheless the trial of these pans on Tuesday will be interesting and instructive, and we hope will attract the attention of a large number of millmen, machinists and miners.

The Washoe.—We yesterday paid a visit to the wreck of this fine, but most unfortunate, steamer, as she lay off Rincon Point wharf. We observed that the hull, with the exception of the stern, through which one of her boilers had been thrust, is but very little damaged, though everything above the lower deck has been torn or cut away; not a particle of her beautiful saloons, state-rooms or machinery remaining; the latter, though but little injured, is scattered about the wreck in all directions; one huge boiler projecting several feet over the stern, while the lofty smokestack lies athwartships, near the bow. The deck planks have been ripped up and torn as if they had been strips of paper, while the beams over where the boilers stood have been lifted up bodily with everything above them. Thick iron bolts bent like wires, and massive timbers crushed and splintered into fragments, and heavy masses of iron work, tons in weight, lying about, attest the power of the mighty element that caused the sad disaster. There were a great many people on the wharf guzing on the wreck—to many, probably, bringing to mind the loved one lost, that perished through the same cause that destroyed one of the fastest and finest steamers ever built on the Pacific coast. We learn that it is the intention of Capt. Kidd to have the Washoe refitted and started again as soon as possible.

The California Wine Business.—Some idea of the growing importance of the California wine business may be formed by the fact that the shipments from this city to Boston, Mass., since January last, has amounted to 140,000 gallons; and there are orders yet unfilled exceeding 1,000,000 gallons. The people of the modern Athens appear to appreciate the merits of our native wines. Some of the Port exhibited at the Fair was equal to any ever shipped from Oporto, of an equal age; and we venture the opinion that within ten years from now, California will be as famous for her wines in the markets of Europe, as for her gold and silver at the present time.

Another California made locomotive has been placed on the Alameda railroad. The fare from this city to the further end of the road is but twenty-five cents—a pleasant and cheap pleasure trip.

The Monitor still continues to progress towards its completion, and to aid the Sanitary Fund by the amount of admission fees. The sum so received the past week was about $400.

Forrest's forces, 8,000 strong, are maneuvering on the Alabama and Tennessee border, 4,000 rebels having crossed the Tennessee at Bates' Landing. Athens, Ala., has surrendered to the rebels and Forrest's intention appears to be also to capture Pulaski, Franklin and Shelbyville.

Gen. Rosseau takes the field and is preparing to receive the rebels. Price is advancing to join Shelby, and threatens an invasion of Missouri. Gold in New York, on Saturday, "fell to 200 and closed at 202."

The Memphis *Bulletin* of Thursday last, reports that Mobile has surrendered to Admiral Farragut unconditionally!

Sheridan had captured so many of the rebels that it required so large a portion of his forces to guard that he applied for and has been furnished with a large reinforcement, to take charge of these prisoners, whose numbers were being hourly increased.

Two Treasury Officers have absconded from Richmond, carrying off two millions dollars' worth of confederate treasury notes.

The rebel authorities have issued an order for the enrollment of all males between the ages of 16 to 50. In many of the districts the slave owners are ordered to send one-fourth and in some cases one-half of their slaves to work on the fortifications.

The Military at the Fair.—By invitation of the managers all the officers and men under command of Gen. McDowell, in this department, have been invited to visit the Fair, during the present week as guests of the Institute. The General has named Tuesday, Wednesday and Thursday, as the days on which the military will visit the Pavilion, between the hours of one and six P. M.

The young gentlemen visitors at the Pavilion on Saturday morning were somewhat surprised, about eleven o'clock, by the sudden advance up the main entrance, of a "moving column" of handsome young ladies, carefully marshalled in pairs, but who soon "broke ranks" and scattered promiscuously throughout the building. They numbered about seventy and were the pupils of the Pacific Female Seminary, at Oakland, under charge of Mrs. Harmon and others. They were accompanied by their teachers.

Children at the Fair.—The children of the Public Schools are now visiting the Pavilion, having been invited to do so gratuitously by the management. The children of the Union Street School, to the number of about 800, visited the Fair on Thursday; those of the Mason Street School, to about the same number, were in yesterday, accompanied by a strong force of teachers. They appeared to be under particularly good discipline. The children of the Roman Catholic Orphan Asylum, also visited the Pavilion Yesterday.

You Can Depend Upon Them.—We would call the particular attention of the visitors at the Fair to the card of J. C. Mitchell & Co., Merchant Tailors, 408 Pine street. They have lately added to their establishment a hat department in charge of which is Wm. H. Mead, formerly salesman with Fisher & Co., hatters, and late of the firm of Mead & Van Tassell. We would earnestly recommend his old customers and all others in want of hats, to give him a call, knowing as we do his ability to satisfy in every particular.

Great Distress in Santa Barbara County.—It is stated on reliable authority that terrible distress exists in many parts of Santa Barbara county, in consequence of the excessive and almost continued drought which has existed there for the past two years. Nearly all the sheep and cattle have died from starvation, while the crops have almost entirely failed. Men and women are suffering for food and the children are crying for bread. The destitution is said to be appalling! We understand that an organized movement will be immediately initiated in this city, to provide prompt relief for the sufferers. The *Call* of this morning states that the managers of the Mechanics' Institute will devote the proceeds of one day's exhibition at the Pavilion in aid of this humane object.

[Tuesday, September 15th.]

Gold tumbled yesterday in N. Y. down to 190 and 180. Postmaster General Blair has resigned and Gov. Dennison, of Ohio, succeeds him. News from Mobile states that a gunboat expedition up Fish river has destroyed saw and grist mills, ship yards and lumber to the amount of $1,000,000.

A military expedition has left Vicksburg. Forrest has captured Elk River Bridge. He continues to massacre negroes found in U. S. uniform. Early was instructed by Lee to hold the Shenandoah Valley at all hazards. It is doubtful if two-thirds of his command evades Sheridan and reaches Stanton. Gen. Rosecrans has called the Missourians to arms. Business in St. Louis is suspended.

State News.—Stockton met with a destructive fire about 3 o'clock this morning. Total loss $30,000. McDonald & Co.'s bank, at Victoria, V. I., has been robbed of $30,000. The above items are from the *Bulletin*.

The Bush Street Public School, located at the corner of Bush and Taylor streets, under the charge of Mr. J. Denman, visited the Pavilion yesterday. This school numbers about 700 pupils. The little folks appear to enjoy themselves much in these visits. They will form a pleasant episode in the history of their schoolboy days and one which will never be forgotten.

The pupils of the Montgomery Street Public School, under charge of Miss Moses, as principal, assisted by Misses Parker, Cushing and Fiske, to the number of 240, also visited the Exhibition yesterday afternoon. After making the usual rounds, the school was drawn up in close order, in the rotunda, where they sang in very excellent style, several appropriate airs, after which they moved to the front of the music gallery where they were saluted by the band. The appearance of this company of juveniles—the youngest grade admitted to the public schools—was exceedingly creditable. It was the youngest, and yet the most orderly delegation which has yet appeared from any of the public schools. We particularly observed that the boys kept their heads uncovered during their visit.

More Salt Discoveries.—A Mr. Bourne, of Austin, Nevada, while on a recent exploring expedition in that Territory, at a place about 75 miles south of a mining camp known as San Antonio, and about the same distance from Walker's Lake, discovered the largest deposit of native salt found on this side the American Continent. It consists of a plain of ten miles square covered with salt, from six inches to three feet in depth. This salt plain is continuous, and is without shrub or sandhill, extending white and glistening as far as the eye can reach. One of the curiosities of this plain is that in the midst of it is a large boiling spring, of exceedingly salt water, and rising from a bed of salt apparently of its own deposit. The spring appears to have been much larger than at present, but its own deposits have so encroached upon it that it has built up a mound of that material, and reduced its aperture to about four feet in diameter. Good fresh water is found in the hills bordering the plain.

An Enormous Yield.—Mr. Hopkins of the Novelty Smelting Works, who has a portable mill and laboratory on exhibition at the Mechanics' Fair, on Friday last operated upon 92 pounds of ore from the Hope Claim, in Eagan Cañon, Nevada Territory, from which he obtained the extraordinary large quantity of 175 ounces of gold and silver! We understand that the vein of ore from which this was taken is three feet wide. If it is all of a character such as that operated upon, the owners of this claim have one of the richest things in the country.

An Interesting Sight.—One of the most interesting sights at the Fair is the blind boy, Abliuo Lawrence, who makes baskets, bags and other articles of bead work of elegant patterns and beautiful designs, with wire, silk and beads of various colors, entirely by the sense of feeling, he being entirely blind.

Dolbeer's Calculator.—This valuable instrument, the invention of Mr. John Dolbeer, 36 Stewart street, in this city, is one of the most perfect and valuable calculators ever introduced. Simple in its form, trifling in its cost, it seems impossible that it can get out of order unless through absolute abuse. The entire instrument consists in a dial about six inches in diameter, around which are circles of figures, which, by means of three indices or pointers, show the numbers, from units to hundreds of thousands, by fixing the unit index to any given number, and turning a small crank attached to some racket work behind the dial, calculates with unerring exactitude any quantity of any article to be estimated, without the necessity of making a figure or any effort of the mind. To lumber merchants, grain and vegetable dealers, and wholesale merchants generally, these calculators will be found of great advantage in the transacting their business. Those wishing to examine their operation will find them on exhibition at the Mechanics' Fair. These instruments are manufactured by Theodoro Kullenberg, Market street, below Sansome. For further information enquire of John Dolbeer, 36 Stewart street, who has them for sale.

California Raisins.—Mr. Bughey, of Folsom, Sacramento county, on Saturday last entered at the Fair a couple of boxes of California Raisins, of astonishing beauty. These were made from the "Fibersagos" grape; a variety which appears, judging from the sample before us, to be remarkably well adapted for the purpose. These raisins, in color, size and general appearance, are precisely like the best imported "Malaga." We are informed that Mr. Bughey intends to make a business of raising these grapes for raisins. The present lot is a sample of 6,000 pounds cured the present season; but, as that gentleman has some 40,000 vines in bearing, of the same variety, he calculates to make nearly twenty tons next season. If he could make treble that quantity they would sell readily, we are certain, as fruit of such a quality would command the market anywhere. We congratulate Mr. Bughey on his success as the pioneer raisin grower of the Pacific; for we believe he is the first that has made a business of raising raisins, though there are a great many others who have made experiments in the business.

Blank Books, Stationery.—The exhibition of articles in this line at the Pavilion of the Mechanics' Fair, by Geo. B. Hitchcock & Co., 413 and 415 Sansome street, is most complete and interesting. The samples of blank books, in particular, are worth the notice of incorporated companies, banks, and the mercantile community generally. In this branch of their business, this firm offers great inducements in point of excellence and price; while their stock of papers, envelopes, cutlery, inks, etc., is unequalled by any firm in the city. Their prices and terms are peculiarly advantageous to the trade. We therefore take pleasure in recommending our friends to patronize the establishment of Geo. B. Hitchcock & Co., 413 and 415 Sansome street.

Geo. S. Dickey, the Pioneer apothecary exhibits Mousell's salt, to show in the first place that he can make a better article than any other man in the United States, and in the second place, that his practical skill and scientific attainments in his business, pre-eminently qualify him for accurately dispensing physicians' prescriptions of pure and fresh medicines. Mr. D. may be found at the corner of Third and Howard streets.

Grand Military Display.—On Tuesday, Wednesday and Thursday of the present week, on the invitation of the Managers of the Fair, the Military will visit the Pavilion in full uniform, with bands and colors flying. These military parades will be worth coming a long distance to see.

The Miners' League.—The President of the Virginia City Miners' League has announced that after the 27th of September, persons who are not members of the League will not be allowed to work in any of the mills or mines thereabout.

Home Manufatures.—In considering the recent rapid growth of our home manufactures, as we have from time to time passed through the labaryuthine avenues at the Pavilion, we have been forcibly reminded of the important bearing which one branch of manufacture often exerts upon another. For instance in examining the California made leather in section 45, our attention has been irresistably called to the influence which the tanning business has exerted in introducing the manufacture of boots and shoes, of hose, belting, harness, trunks, etc. Even the carriage business is largely promoted by the facility thus obtained for procuring any desirable quality of leather, promptly, when needed. Again the hatters, bonnet makers, pill makers, etc., have built up several extensive manufactures of pasteboard boxes, which are now made in great numbers of different forms and sizes in this city. So also the increasing manufacture of jewelry, cutlery etc., has created such a demand for show cases, as to make that quite an important speciality in our home industry, some fine specimens of which are on exhibition at the Pavilion. The skill of our artists and the appreciative taste of Californians has also opened up a large business for the manufactory of picture frames, which are now made in this city in a style and excellence which can scarcely be excelled elsewhere. The establishment of powder manufactures is also giving employment to a large number of mechanics in the manufacture of powder cans and tin canisters, which latter are now turned out in great numbers. We might thus go on, *ad infinitum;* but we have said enough to convey some idea of the important influence which one branch of business has upon another in building up new branches of industry and increasing those already in existence.

The Attendance at the Pavilion yesterday, was very large, no falling off whatever is noticed as yet. The receipts are now somewhere in the vicinity of $33,000, which must be a large figure over the entire costs up to the close of the Exhibition. The receipts of the skating pond, yesterday, were $33; of the cheese, $29; of old Sanitary, $18.70; total $80.70 for the Sanitary Fund.

Colorado Ore.—One hundred sacks of copper ore, assaying 50 per cent, was landed a few days since on Commercial street wharf, from the Planet mine, near the mouth of Williams' Creek, in the Colorado valley. Five hundred sacks of the same quality are now at the mines ready for shipment. The establishment of steam navigation on the Colorado will soon build up an immense trade between that section and San Francisco.

Effects of Home Manufactures.—We see it stated that the recent reduction in the price of coal oil lamp chimneys is the result of the successful establishment of the Pacific Glass Works. The reduction is from 20 to 10 cents; an important item in many families in the course of the year.

Terrible Fatal Accident.—About seven o'clock this morning, while some men were engaged in putting up a pair of shear legs for the purpose of hoisting some heavy weights from a vessel at Norths' ship yard, at the Potrern, through some mismanagement, the heavy timbers fell over, falling upon two of the men, killing one Dan Stowell, instantly, and smashing the legs of the other in such a horrible manner that but little hopes are entertained of his recovery.

The police force of the city has been increased by an addition of thirty-eight to the usual number, to continue until the 15th of November. This increase has been made with reference to the unusually excited state of the public mind, growing out of the present extraordinary election canvass.

Silver from Lower California.—The John L. Stephens, which arrived on Sunday, brought up thirteen bars of silver from the Triunfo Gold and Silver Mining Company, valued at $3,187. A 10-stamp mill has recently been put up at the mine, and the above is the result of the first crushing. The bars are to be seen at the store of Messrs. Henry & Alexander, on Montgomery street.

[Wednesday, September 28th.]

A New Invention.—The Messrs. Schuster Brothers, No. 102 Kearny street, have invented an ingenious "Portable Fire Place," for the use of soldiers, prospectors and miners, as well as travelers upon the prairies where wood is scarce and the winds blow hard. This device consists of strips of sheet iron, or tin, fastened together by means of hinges, which, when not in use, can be folded up similar to a book. An adjustable cover is placed upon the top for the purpose of preventing the rain from putting out the fire. A rod or crane extends from one side to the other, on which are pot-hooks ready to hang the kettle on. The whole is kept in place by means of light, sharp pointed iron stakes, and can be adjusted in a moment's time, ready for use. The whole weight of this frame need not exceed twenty-five pounds, and can be safely carried fastened underneath the wagon of the traveler. This frame can also be turned to good account as a shield against the arrows of hostile Indians—those unyielding foes of the traveler across the plains. The invention is certainly novel, cheap, and practicable. A patent for it is now pending, through the Mining and Scientific Press Agency.

Honor and Enterprise Win Success.—There is scarcely an intelligent miner or mechanic in the State of California who is not more or less familiar with the name and firm of R. H. McDonald & Co., Druggists, of Sacramento, who have recently opened a new and extensive establishment in this city, on the corner of Sansome and Pine streets, near the Brooklyn Hotel. This firm has long been classed among the largest and most successful importers of the State, yet their business and good reputation seem to be still spreading. Were we called upon to write the secret of their business attainments, we should simply say that buying superior drugs and selling them at moderate profits is the lever of success in the apothecary business in any intelligent community.

Not Our Fault.—We wish it distinctly understood that we are not responsible for the omissions from the catalogue of entries not made in proper season at this Fair, its predecessors, or the World's Fair at London, any more than we are liable for the omission of the Apocryphal Books from Harper's edition of the Holy Bible. The principal omissions occurred in the catalogue because exhibitors, unfortunately, like printers, didn't know everything beforehand, and consequently failed to make proper entries, which is not the fault of the managers or the printers. The list of entries, however, will be revised, and published, as usual, with the reports of the exhibition; and notice of any errors which have occurred in the first publication should be immediately given to the Executive Committee.

A New Importing House.—As an evidence of prosperity in the growth of our city, we note the welcome fact that during the past year quite a number of the heaviest and most prominent tradesmen of the interior cities have established principal houses in San Francisco. We welcome to our circle all such new comers, for their successful experience vouches for their reliability as safe and honorable business men, thoroughly identified with and interested in the prosperity of our new State. Among this class we may mention Messrs. I. S. Van Winkle & Co., who have established, in a convenient situation at the corner of Battery, Bush, Market and Front streets, an extensive warehouse of Iron, Steel, Hardware etc. They come well recommended from Sacramento, where they still retain a very large branch.

Well Behaved Children.—Yesterday afternoon six hundred of the Fourth Street Primary School, and an equal number of larger boys, belonging to Rincon School, headed by the colors of their country, and the martial music of the drum and fife, marched through the Pavilion with so much propriety, and examined the many objects on exhibition at the Fair, with such intelligent interest as gained for them the respect of the great many ladies and gentlemen who witnessed with pleasure their good behavior.

"What is Home Without a Picture?"—And why will you be without the pleasure and luxury of pictures in your houses, offices and workshops when elegant, amusing and refined specimens of the beautiful and ennobling works of the best of artists can be had for a mere trifle at the universally cheap picture and picture frame store of B. McQuillan, 209 and 211 Leidesdorff street? It is always sensible to trade where you can get a good article at the most reasonable price, and for such a purpose we recommend Mr. McQuillan, whom we have patronized with the best of satisfaction.

California Gold Pens.—Among the most desirable articles of San Francisco manufacture, exhibited at the present Fair, are the diamond pointed gold pens, made by Mr. A. J. Haight, at 434 California street. By competent judges they are universally pronounced a superb article, and we speak understandingly when we say it is policy and economy for our citizens to purchase pens of Mr. Haight *in preference to any imported article.* They ought to draw a big prize, and whoever gets one of Mr. Haight's warranted pens will award him the first premium, surely.

Liberally Circulated.—In issuing the Catalogue of the Mechanics' Fair, the publishers made every effort to produce a book typographically superior to any of its predecessors on this coast, and its fine appearance in this particular is highly spoken of by practical printers. A large edition was printed, a portion of which we have taken pride in sending, as originally intended, to every newspaper, public library, Masonic and Odd Fellows lodge, and other associations in the state possessing libraries and public halls. We have done this for the benefit of the Institute, ourselves, and all parties interested in the Mechanics' Fair and its Catalogue.

The Receipts and Expenditures.—Up to Saturday last the expenditures on the Fair Building, and matters connected with the Fair, have amounted in round numbers to about $32,000. The receipts up to the same date had fallen short of this am't $1,500. This has been probably made up since, yesterday alone more than half that sum was taken for admission to the pavilion. The receipts for the Sanitary Fund yesterday were—admission to the Skating Pond, $31; to the Big Cheese, $39.40; and Old Sanitary gobbled up $13; making a total of $83.40.

Ore From Humboldt.—The Red Bluff *Independent* speaks of a lot of very superior ore which lately arrived at that place from the Sheba and De Soto mines, in Humboldt. It describes one chunk of ore from the De Soto as of extraordinary richness and weighing over 500 pounds.

Another lot arrived about the same time from the "Godfrey Series," in Puebla district, Humboldt, which the *Independent* says averages higher than that from the De Soto.

[Thursday, September 29th.]

The Children at the Pavilion.—One of the most pleasurable emotions to be enjoyed at the Pavilion, is to stand at the main entrance door and watch the school children as they come marching in, and to witness the joy and happiness which beams from their bright little faces as they hurriedly cast their eyes around to take in the first grand view there presented. Many of them come in tired and weary with the long walk from their distant school rooms, as may be readily noticed from their flushed countenances and the languid step with which they reach the outer threshold. But no sooner do they get a glimpse of the display within, than their countenances brighten with joy, their languor is dispelled, and the little pattering feet come down once more firmly upon the floor, as they endeavor to catch the time of the music and move in unison therewith. To our mind these visits form one of the most pleasing and suggestive features at the Pavilion. The sight of these little ones as they come marching in to the music of the Union, is eminently suggestive of hope and trust in the future of our State. Who can tell the immensity of joy and happiness that has been given to these children by the gratuitous exhibition which has been thus extended to them by the managers of the Institute. God bless these little ones and may prosperity ever attend the noble institution which has thus made them more than happy.

The Attendance at the Pavilion, yesterday, was quite as large as usual. During the day there were several interesting tests of machinery. The Committee on Fire Hose instituted a test, by the aid of Stoddard's pump, which has an index noting correctly every pound of pressure on the valves. A piece of double rivited hose manufactured by H. A. Cook, of Battery street, from leather tanned by Henry Miller, of the Sixth Street Tannery, stood a pressure of 175 pounds to the square inch before bursting. Single rivited, of the same make, stood 165 pounds. A trial was also made of hose manufactured by Mr. Folsom, from leather also tanned by Mr. Miller, with about the same result as above. The above tests indicate great power of resistance, and reflect much credit on the manufacturers. No eastern hose ever brought to this market would stand a better trial. Some idea of the extent of this branch of our local manufacture may be formed from the fact that at the establishment of Mr. Cook, alone, 1,500 feet has been made, to fill orders from the country, within a very short time.

There was also another interesting trial of the crushing capacities of Fauchery's Crocodile and Hanscom's Rock Crushers. An equal quantity of rock—about half a ton—was given to each machine. The machines were carefully timed; the rock will be weighed, and the judges will pronounce upon the quality and quantity of the work this morning, probably in season for the result to be announced in our second edition.

The receipts of the skating pond yesterday, were $30; of the cheese, $30.42; of Old Sanitary, $16.45; total, $76.88 for the Sanitary Fund.

Mining Laws.—The new laws regulating mining transactions by incorporated companies are very rigid—unnecessarily so we think. But just or unjust as the laws may be, so long as they remain upon the statute books of the State, it is highly essential to the interest of every good company that they be strictly complied with by Secretaries, Trustees and all officers and stockholders of incorporated bodies. We regret that our observation prompts us to say, that not more than one-half of the sales made of delinquent mining stocks advertised in San Francisco, are in strict accordance with the letter of the law governing the same, and we tremble for the day of retribution, which will surely come, if many of the claims now being illegally sold become of importance. It is the duty of every one interested in mines to thoroughly post themselves in the laws governing the same. To do this, we know of no better method than purchasing Bancroft's Mining Laws and Forms, compiled by Mr. H. B. Congdon, a competent Attorney and Mining Secretary.

Lithographs and Engravings.—Some of the finest specimens of lithography yet produced on this coast have been drawn by Geo. H. Baker. As a sample of his work we refer to the fine view of the Grand Pavilion, published by the publishers of the Press, and engraved by Mr. Baker. We have heard none speak otherwise than in its praise. Mr. B's office is at No. 522 Montgomery street.

Liberal.—Frisbie's band have volunteered their services at the Pavilion, for Monday next, for the benefit of the sufferers in the southern counties.

Evidence of Appreciation.—In Saturday's issue, in closing our "forms" in haste, we were compelled to omit the advertisement of Messrs. Bartling & Kimball, practical book-binders, corner of Clay and Sansome streets. We were 'rejoiced' this morning to learn that the omission, was noticed, and we make haste to give a fair explanation. Our weekly is issued on Saturday, with full stock reports, consequently our printers are unusually busy on that day. It is a significant fact that not a single line of advertising has inadvertently dropped from the columns of the Daily Press, without our being almost instantly notified of the fact.

Visitors.—The inmates of the Deaf and Dumb Asylum visited the Pavilion yesterday; also the pupils of the Public School, at the corner of Fifth and Market streets.

The Whale.—It is stated that fully 1500 persons yesterday visited the whale, now lying upon the beach near the Cliff House.

City Stock Reports---San Francisco Stock and Exchange Board.

From the "Weekly Stock Circular" of the Associated Brokers.

San Francisco, Saturday Morning, Oct. 1st, 1864.

The business of the Board during the present week has been larger than that of any previous like period for months past. With scarce an exception all stocks that ars commonly dealt in have been buoyant, at better prices. Leading shares have materially improved and ars in favor at ths advance. Most of thcse claims are now yielding largely and their present condition is such as to inspire the belief that they are not likely to becoms less productive for some tims hence. Some of them, although not as yet dividend paying, are rapidly curtailing their indebtedness, and preparing to accumnlate a fund for stockholders. More economy and hetter judgment is now used in the administration of ths affairs of these Companies, and the good results of such a policy will soon be apparent in increased profits. Quite a number of low priced stocks have heen activs this wesk, and formed quite a feature of the daily transactions. Many of this latter class douhtless possess soms merit, hnt ths advance in certain other shares is said to be solely predicated upon the speculative fever of the moment.

Legal Tender Notes were largely dealt in since Saturday last, at variable rates; advancing from 49 to 53¾, declining to 51, seller 60, rallying to 53, at 10 days, receding to 50½, seller 60, and closing last evsning at $52. $397,000 were sold at these figures.

Gould & Curry fell from $1,120 to $1,050, seller 60, then steadily advanced to $1,300, buyer 30, and was held last evening at $1,300. Within this rangs 57½ feet were sold. The Company ars vigorously progressing with the several shafts sunk from ths lower works, and it is rumored that a hody of good ore has heen met with recently which may lead to an extensive deposit. Receipts of Bullion for the past month amount to some $200,000, and the regular dividend of $50 per foot will he declared.

Savage has hecn somewhat inactive hut well maintained, advancing from $1,275 to $1,330, and closing at $1,400 hid, $1,425 asked. Ten feet were sold. This mine is said to be looking cxtrcmely well, and discloses more ore than at any former period. In addition to some 4,000 tons of ore sent to different mills last month, shipments of first class ore were made to England. The Company are now drifting for the North Potosi chimney and will soon be at work on this vein. Receipts of Bullion last month exceed $150,000, and after ths payment of the regular dividend a considerahle snrplus will remain at ths credit of the Company.

Potosi is in rather less favor and 12 feet were sold, advancing from $700 to $770, receding to $725, and closing at $720. The evidcnce in the suit of this company with the Bajazet, has heeu submitted and the case will he argued and given to the Referee in a day or two. Considerabls testimony has heeu presented by both sides, hut an early decision is looked for.

Chollar rose to $725, declined to $675, rallied to $700, scller 30, and sold yesterday at $695. 76¼ feet changed hands. A late crushing of 130 tons of ore from this mine yielded $79 per ton. Five mills are at this time constantly cmployed in reducing about 100 tons per day. Ths lode in the South mine is now 26 feet wide, four-fifths of which discloses thus far very valuable ore. The drift on the eastern face of this vein is 60 fect in length and continnes to look well. In the North Mine, a depth of 63 feet has been attained from the 4th levsl, and within the ensuing 15 days the fifth level will he opened, communicating with the drift from the main shaft. The yield of this mine for the month of September amounted to some $75,000. Ths debt of the Company has been materially rcduced and thc product of the mine for the current month will, it is believed, entirely extinguish it, leaving a surplus in their treasnry.

Yellow Jacket ohtained rather less favor this week. Twelve feet were sold, declining from $650 to $600 and closing at $580 hid, $600 asked. The north drift has met with a deposit of a promising character, thc vein containing a seam of choice ore at this point. Belcher is improving and one foot was sold at $620.

Ophir rose from $330 to $355, sold at $34, seller 60 days, and was held last evening at $350. Fourteen feet changed hands within this range. No new developments have taken place recently. The Compauy are prosecuting work energetically and anticipate favorable results from their low grade ores in their new mill which will he at work in a day or two.

Hale & Norcross suddenly rose from $250 to $400, hnyer 5 days, and closes at about $350 We havs no definite advices from this mins but learn that recent indications are favorable in the lowsr drift. Uncle Sam was sold at $175@$200—assessment of $100 delinquent—and is now in some request.

Sheba has been dull and inactive at from $70 to $72. The Company received on Wednssday last a shipment of 428 lbs. of Bullion, the valus of which has not been ascertained as yet.

Imperial declined from $150 to $145, ross to $152, and is now inquired for at $151. 50 shares were sold at these rates.

Burning Moscow has been a conspicuous featnre of ths market and 1618 shares werc dealt in since Saturday last; advancing from $32 to $57, declining to $53, rallying to $75, dropping to $55, then rising to $70 and selling at the closs at $60 The cause of this sudden and unexpected movement is only known to those in the interest of the Company and to other prominent stockholders. A mysterious reticence prevails and it is difficult to ascertain if ths riss is predicated npon anything in the mine or whether it is solely the result of a speculative combination to entrap the unwary.

North Ophir advanced to $165. Scvcnty feet changing hands. The short interest will it is thought experience some difficulty in making deliveries. Wc may at another time venture somo remarks npon these transactions.

Nevada, J. G., is well sustained at the recent advance and 285 feet werc sold within the rangs of $37@$51, closing at about the latter figure.

Wids West continues strong and 545 shares have changed hands advancing from $26 to $35 and selling yesterday afternoon at $35. The last crushing of 28½ tons of orè yielded $49 per ton.

Golden Age & Empire has met with dccided favor, rising from $6¾ to $19—owing it is said to the discovery of a good lode of ore 32 feet from the surface, in drifting from the main shaft. Sales were made yesterday at from $15½ to $19.

Lady Bryan has been active, and 1602 shares were sold at from $5 to $9. Baltic dcclined from $25 to $22. North Potosi was sold at $10; Daney at $20; Bullion at $55; Santa Rosa at $18½; Antelope at $115; Utah at $6 and Melones at $10.

Real Del Monte rose from $17½ to $38. Buckeye was sold at from $5½ to $13; De Soto at $17½@$15; North American at $25.

The aggregate sales of Stock and Legal Tender Notes sincc Saturday last amount to $ 535.081.50.

Zenith, Calaveras co., 50c	Sep 17—Oct 3

Those marked with an asterisk (*) are advertised in this journal.

[The mining community begin to appreciate our reasonable rates of advertising, and are turning their patronage to the journal most properly entitled to receive it. The advantage to shareholders of having all mining notices concentrated in one mining journal, is obvious to all, and our terms have been established with a view to effect such a consolidation; and most companies having an object for publishing in any other particular paper, can consequently afford to have their notices appear in our journal also — EDS. PRESS.

Important to Secretaries.

Secretaries will please write proper names and figures distinctly, and hand in their advertisements as early in the week as practicable. Our latest forms go to press Friday evening. Any information concerning the requirements of the laws regarding advertisements will be cheerfully given when solicited. Inspect all your notices carefully upon their first appearance. In case of postponement, give the earliest notice possible at the office. When copy is received sufficiently early, a proof-sheet will be furnished if desired. A revised copy rendered, for advertising at the mine, when requested. Neatly printed copies of advertisements, for serving individual notice to stockholders, printed at $1 per hundred. Copies of the new advertising law, as officially published, furnished gratuitously. ☞ Blank forms, for filling out Assessment Notices and Delinquent Sales, supplied free to advertisers in the MINING AND SCIENTIFIC PRESS on application at the office

REVIEW OF THE FAIR.

843. In the northwest corner of section 25, and near the entrance to the right hand Arts' Gallery, W. T. Garratt exhibits two cases of elegantly finished brass work, from his Foundry on Market street. The articles consist of throttle valves, steam guages, steam whistles, water faucets, hose pipe. hose coupling, engine torches, etc. In durability and finish these artieles will bear comparison with any which can be produced from Eastern manufactories, and fully attest the excellence to which this branch of home industry has arrived in California. Mr. G. also exhibits a large collection of Reeves' Improved Oil Globes, for oiling cylinders, when under steam pressure. This is also a product of his foundry.

857. On a table, opposite the above display, J. Barman exhibits a lot of pottery, consisting of flowerpots, vases, etc., manufactured ust out of the city, on the San Bruno road.

679. D. Brannon also makes an exhibit of pottery, from his manufactory at San Antonio, Alameda county. The chief exhibition of Mr. B., however, is the fine display which he makes of Terra Cotta ornaments, consisting of brackets and bosses, hanging flower vases, etc. These ornaments are made from a peculiar clay known as Terra Cotta, which we understand is found in great abundance near San Antonio. This material for such work is much preferred to Plaster of Paris, or any other substance. It is durable, neat and cheap, and is fast coming into general use in this city.

246. H. Herzer, of Kearny street, exhibits a lot of crucibles, muffles, etc., on the same table. This display of pottery and its kindred manufacture, is quite sufficient to show that we have material, in the immediate neighborhood of this city, to open up a large and lucrative branch of industry, which will doubtless in time be fully improved.

794. Akin to the above we may notice several specimens of fancy work, for the writing and toilet table, manufactured from Steatite, by James Patterson, of Placerville, El Dorado county. Immense beds of this material are found in various parts of the State, which will eventually come into great demand for fire-proof and ornamental uses.

849. Another indication of a branch of industry, as yet but little thought of in this State, may be found on this table, in the shape of two baskets, made by a Chinaman, of common rattan; although any quantity of willow is found in various parts of the State which forms a most admirable article for such work. These baskets are exhibited by Mr. B. Dougherty, No. 11, Metropolitan Block; who has placed them in the Pavilion as samples of what can be done, if any encouragement is offered in that direction. The work presented is very substantial and neat. Orders for such work will be received by him, of any style or pattern which may be desired.

468. Cans and casks manufactured for the California Powder Works Company. These specimens of California workmanship are equal to anything of the kind produced in the Eastern States. The demand for them will soon be very large, and will form an important addition to our domestic industry.

13. A. G. Dexter, of 108 Kearny street, exhibits three lever door gongs, which appear to have many advantages over the ordinary door bell. They are not liable to get out of order; they give notice all over the house, by their great sonorousness. They can be modified to any degree of sound, by padding either the hammer or gong. They may also be used as a plate for the name and number. This is a California invention, for which letters patent have been applied.

780. Mr. J. O. Wright, of San Francisco, exhibits Shepard's Patent Blind Hinge and Fastener, a late Eastern invention of considerable merit and conveuience. By this invention a person may open, close or fasten in any desired position, a window blind from the inside of the room without opening the window. It can easily be applied to blinds already in use, with the ordinary fasteuings. Mr. W. holds the right for this State. He also exhibits window and curtain fastenings, of different patterns.

406. G. W. Guion exhibits two large show cases well filled with various implements of hardware and cutlery from their store, 606 Market street.

733. Caleb M. Sickler, 422 Kearny street, exhibits three cooking stoves, "Autocrat of the Kitchen," and two sizes of "Stewart's Stove," with all their furniture—each a really substantial and indispensable article of kitchen furniture.

659. A. P. Brayton, 103 and 106 Sansome street, exhibits "The Peace Maker Stove," also a very fine cylinder parlor or office stove.

389. Lock & Montague, 112 and 114 Battery street, exhibit the Good Samaritan Cooking Stove, set up in a "kitchen" neatly fitted up and fully furnished with every conceivable variety of utensil needed in such a place. This "kiteben" appears to form a great attraction for the ladies. We presume the chief portion of the articles on exhibition here are of home manufacture—at any rate they ought to be.

13. Under this number, Tay, Brooks & Backus, exhibit, among other things heretofore noticed in our columns, the only California made stove in the Pavilion. We regret that we are not able to report more progress in this branch of California industry. Immense numbers of stoves are used on this coast, and their demand is rapidly increasing. It is to be hoped that when another exhibition of this kind occurs in San Francisco, we shall be able to record, as a fact, that we are manufacturing our own stoves, and that we shall be able to make a fuller display in that branch of business. The experiment in this direction, of Messrs. Tay, Brooks & Backus, is highly creditable to them, and we trust they will soon find it to their interest to greatly enlarge that branch of their already extensive manufacture.

314. W. F. Ensign exhibits Lillie's Monitor Bank Lock. It is said of this, that it is the only bank lock in the United States that has not and cannot be picked. The curious or interested in such matters will do well to critically examine this wonderful puzzle to burglars.

312. The Russell & Erwin manufacturing company, 106 and 108 Battery street, exhibit three of Lillie's wrought and chilled Iron Safes, each elegantly and elaborately finished. The same firm also exhibits an assortment of door knobs, locks, etc.

424. In section 45, to the left of the main entrance, Henry Miller of this city, exhibits a very fine assortment of California tanned leather—calf, kip and sole, also several lengths of heavy hose for engines, and a quantity of leather belting. The large belt on the driving wheel of the steam engine in the Pavilion is of Mr. Miller's make. Mr. M. produces all kinds of leather at his establishment, for boots, shoes, belting, harness, trunks, carriage work etc.

390. G. K. Porter exhibits a number of cases of gents' boots manufactured in this city. The assortment embraces fine boots, brogans, etc. They are well made and look quite as well as the same class of articles from Eastern manufactories. This exhibition furnishes evidence of the facility we have here for supplying our home demand for this important branch of manufacture. We presume the business pays or it would not be so extensively carried on.

410, Kreitz & Cosbie, of 36 Battery street, exhibit a fine assortment of Horse Collars—horse collars for stage, buggy, team and mule. These collars are made in every desirable style of finish, and are fully equal to the best which can be imported.

451. Wm. Berney, 318 Jackson street, exhibits a machine of his invention, for filing circular saws, which saves much hand labor, and does its work far more perfectly than it can be done by the most skillful operator in the usual way. The saw is held firmly in its place, and adjusted to the file by the simplest form of mechanism. The file is made to pass over the tooth of the saw, backwards and forwards, precisely as if held in the hands, its movements being controlled by cams and cranks. The machine is driven by a crank, or it may be readily attached to any motive power.

756. Two of Tapley's patent, Self-Feeding Hand Sawing Machines, exhibited by David Dodge of this city. This machine is a simple application of the circular saw to hand power, for light shop work. It is so constructed as to feed itself by a set of revolving teeth, when its work has once been placed before the saw, thus giving the operator an opportunity, if he desires it, of using both hands to the crank. One man, or a stout boy even, can rip a two inch hardened board, or a three inch pine plank, in one third the time that would be required to perform the same work by an ordinary hand-saw.

Steven's Pressure Packing for Steam and Water Pistons. This is a recent California invention, placed on exhibition within a few days and neither catalogued or numbered. The principle on which it works is by the admission of steam into the body of the piston, which by its pressure, expands the rings steam-tight against the wall of the cylinder, and that, without producing any undue friction.

781. Leclerc's Reducer and Amalgamator, which may be seen near the DAILY FAIR PRESS, is something quite new in the way of amalgamating machinery. This machine is an upright cylindrical tub, about four feet high and eighteen inches in diameter. Within this tub, are placed, in a perpendicular shaft and at short intervals, six grinding surfaces, each with its own set of mullers, forming, in fact, a series of six small amalgamators, placed one over the other. The ore is fed in at the top, and passes down through and between the several grinding surfaces by the force of its gravity. The amalgamation and concentration takes place at the bottom of the tub, through which an upward stream of water is made to enter; the discharge of gangue being effected at a hight of several inches above the bottom.

The exhibitors of home made carriages, wagons, buggies, and carts would do credit to any workmen in the world. Some of the carriages are really elegant, and for lightness, symmetry, strength and beauty can scarcely be excelled.

401. G. P. Kimball & Co., exhibit an elegant family carriage and a trotting buggy; also a large size model of his patent goose neck truck. Mr. G. P. Kimball, individually exhibits one Park Phæton.

818. E. G. Woodside, San Francisco, exhibits a model of an improved Carriage Spring and Thoroughbrace Reliever. This seems to be an invention of some importance, and should be examined by carriage builders.

307. W. O. Willey exhibits a number of single and double carriages of very fine workmanship—on improved forms—made by W. R. Brown of this city, several of the single "Rockaways" in the list possess the novelty of being covered with prunella, an excellent substitute for leather, being tighter, less expensive, much cooler, and most excellent for its possessing the quality of not causing the dust to adhere to it, as is the case with all kinds of leather. These single "Rockaways" would be splendid affairs for members of the medical profession as they are tight, cool and aristocratic. The work on these carriages bears evidence of having been done by a master hand at the business, every detail and point being finished with the greatest accuracy. We have known Mr. Brown their builder for many years, both in this State and in Massachusetts, where he had the reputation of building the best and cheapest carriages in that state, a reputation he fully sustains in this. We commend these carriages to the special notice of gentlemen about to purchase such articles, as they are cheaper, durable, and of the most fashionable and improved forms.

233. Bath & Morrison, exhibit a Butcher's Cart of very superior make. It is presented without paint in order to show more perfectly the manner of workmanship. The heavy use to which these two wheeled vehicles are subjected by their Jehu drivers, over the rough pavements and railroad tracks of this city, renders the necesity of substantial workmanship of the first importance in their construction.

90. M. Curtis exhibits an express wagon, for carrying pianos, manufactured at his shop on Clementina street.

304. E. C. Brooks exhibits a buggy mounted upon an improved Spring which he has patented, whereby greater comfort and ease is obtained in riding, and the vehicle rendered more elastic and ornamental than by the use of the ordinary spring.

286. T. B. Lamb, San Francisco, exhibits a self-adjusting Coffee Roaster, a very simple and ingenious contrivance for performing the tedious operation of roasting coffee. The coffee is placed in a longitudinal cylinder, constructed of wire cloth, and hung upon two bearings. To one end of the cylinder is attached a clockwork piece of machinery, which on being wound up, turns the cylinder gradually, so that when placed over the fire or a hot stove, the coffee is gradually roasted, without any further attention. A California invention.

621. S. D. Simmons, of San Francisco exhibits an egg and cake beater of his own invention. It consists of a frame on which two cog wheels are mounted, to one of which a wire beater, like that ordinarily used, is attached by one end, in such a position that the opposite end, is made to work in any ordinary dish with precisely the same motion that is given to it when worked by hand.

623. Thomas Kendall, of San Francisco, exhibits an improved mining riffle of his invention, constructed in the form of an ordinary sluice, the joints of which are so arranged, when in operation, there is an opening in the joint through which any substance such as gold, amalgam or quicksilver would drop into a pocket beneath the sluice, while the water and earthy or lighter particles must pass on with the current. We are not aware how the principle works in practice, but it certainly appears to be valuable. It is inexpensive and can be arranged by any miner who can make a sluice box.

The same party exhibits two sheet iron mining pans, of his own invention, which are so constructed that they can be used with perfect freedom, and without any fear of a loss of quicksilver. The lighter portions or earthy matter may be freely worked off, but after the pan is washed down close it would be next to an impossibility, without design, to throw over any quicksilver. The only thing that suggests itself to our mind is how the miner is to get the quicksilver out when he desires to do so. The principle of the construction is a false side to the pan, closed at the top or side and open at the angle which forms the bottom, so that when the pan is turned up, the quicksilver and amalgam hides itself beneath this false side.

495. Conroy & O'Connor exhibit one of Doyle's Patent Pulley Blocks, by which a man can hoist 1,000 pounds with ease. This invention appears to attract considerable attention, from the fact that the weight raised will remain suspended at any required point, and cannot by any possibility "run down," unless assisted to do so. This is a most novel and invaluable principle, and is acquired by a system of balances connected within the block itself and its ingenious toothed connection with the chain. Lifting and lowering are effected by pulling at opposite sides of the slack chain. This pulley is being very generally introduced in warehouses, foundries, and all other places throughout the Eastern States where it is required to raise heavy weights.

338. J. B. Hamma, of this city, makes a fine exhibition of snuff and tobacco, manufactured by him from California grown staple, which he says requires only age to render it equal to the best imported. He has been engaged in the manufacture about two years, and says that although it finds a ready sale at the retail shops, he finds it very difficult to introduce it into the wholesale trade. It is the opinion of Mr. H. that when the culture of tobacco is better understood in the State, and prices of the raw material held at lower rates, its manufacture will reach considerable importance.

441. R. F. Gelien, of this city, exhibits seventeen cans California grown tobacco, six of which are the natural leaf, and the balance manufactured into various forms for smoking and chewing. Mr. G. is a wholesale manufacturer. He used up 40,000 pounds in 1863, and will require a much larger supply for the present year. The principal demand is for plug, which brings 45 to 65 cents per pound. It commands about five cents more than the best Eastern article.

670. W. D. Ront, nf this city, exhibits a Tire Upsetter and Puncher cnmhined, and worked by a toggle lever. Thn ndditinn of tho punch, which is quite a powerful nne, makes the machino perform a double service.

616. Van Winkle & Duncan, nf Sacramento, exhibit a Tire Upsetting machiue, which is nperated by a prngressive lever.

Ira D. Card, of this city, entered too late for the catalogue, a Tiro Upsetter to which the the power is applied by a toggle joint and lever. This is a California invention, patented by Mr. Card. These tiro upsetting machines effect a great saving of labor, and it is a matter nf no inconsiderable surprise thut sn few nf nur machinists and blacksmiths nvail themselves nf their advantuges. By one of these nsoful machines, a tire four by nne inch in size, can be upset one quarter of an inch at one heat Carriage nxles, or any piece nf iron of similar size, can he shortened in the same manner, and at less than ono quarter nf tbe nsual time and expenso that would be necessary without the use of these machines.

206. W. W. Dunn, San Francisco, exhibits a Rock Drilling Machine, tho only one on exhibition, and a California invention. It is a mntter of no little surprise to many, that while rock horing machines have heen for a long time in successful nperation in nther parts nf the world, no one has had the enterprise to pat them to a practical test in California where, above all other places, ono would suppose they would be of thn greatest service. There are two of these machines in this city, operated upon different principles, either of which, we holieve, are quito as effective, if not mnre so, than those which for several years past have been doing such good service at tho Mount Cenis tunnel in the Alps. Will not some one of our wealthy and enterprising mining companies, take one of these machines, and give it a test? The cost would he trifling, whilo if it proved a success, the benefits that would accrne to the miuing interest will be estimated by the millions. Neitber of the parties owaing the machines are mine owners, or have the means at ready command to give them a fair trial.

443. D. L. Perkins, of Onkland, the pioneer soed grower of California, exbibits 101 varieties of seeds, of his own raising. Mr. P. is prohably the most extensive seed grower in America. He raised ten tons of seed last year. He has been in the business some six years; eame to this country from the Shaker settlement at Canterberry, N. H., where he was for a long ime head gardener. Mr. Perkins makes this nnrtment of agricnltnre a speciality. His ss1s are always what they pretend to be, and ar'ecured and put up in the best and most appved manner.

67 J. R. Nickerson, of Lincoln, who exhibits large variety of natural fruit, has also nnteresveral packnges of dried fruit. His exhibiti of this speciality would havo been larger, bu ne of his boxes containing dried fruit was in its transit to this city. This we believe, the only exhibition of dried fruit at the Pavil—a matter to be regretted from the fact, tha, evinces the bestowment of quite too lit attention to so important a branch of indu. Large quantities of dried fruits are cons d in California. For the first ten years o r existence as a State the nnly dried fruit u here was necessarily imported, but now, w our gardens and ranches abound with the t fruit in the world, and we enjoy the cleares d finest atmosphere for drying in the worl nere is no reasoa why we may not becom porters instend of importers nf tbis artic .

Catalogue of the I —We have received from Dewey & Co., pu rs, a copy of their newly issued *Descri Catalogue of the Fourth Industrial Fair he Mechanics' Institute*, a pamphlet of tes. It is published by authority of the ute, and is conveniently classified. The ber of entries given is upwards of 800 perhaps a few more have been made since printed. The number of a atalogue was Gallery is 925, of which up in the Art paintings, drawings, sketches, of 700 are otographs. —*Evening Bulletin.*

A NEW EXCAVATOR.

In section No. 14, Mr. Barker nf this city, exhibits a neatly constructed model of a new steam excavator and ditcher, of his invention, which appears to merit some especial attention. This machine is designed more particularly for work in our large river valleys; and if a large machine could he constructed, of full working capacity for, say 25-hor-e steam power, we can but think it would prove of great value in reclaiming large tracts of land, now worthless from winter overflows. It is claimed by the inventor, and with a good show of reason, that a machine of that power will perform the work of 150 men, at an expenso not exceeding $25 per day. It will work in any of our river bottom lands, where the soil consists of loam, clay or sand, a description of soil which answers to the chief part nf the land in the state which requires leveeing.

The frame of the machine is constructed much after the manner of an ordinary platform railroad car, moves npon four wheels, with a plowshare preceding each forward wheel, and a gang of plows attached to the frame and following the rear of the machine. The after plows are set, *en echelon*, and their duty is to turn up a furrow, and carry the same, the one to the other, towards the right hand side of the machine where it is deposited in the form of a ridge. On the right hand side of the machine, about midway, is set a large shovel worked by two cranks which shovel up the earth from this ridge, and toss it up and outwards in such a manner that by two or three passes of tho machine along a given track, a large ditch will be formed beneath it, into which it settles as it works, while the earth is thrown ont upon the right hand side in the form of an embankment or levee. The working portions of the machine are extremely simple, much more so than the machinery of the "steam paddy," and judging from what that machine accomplishes there does not appear to be any question but that the principle of this machine is perfectly correct, and if properly built would accomplish all that is claimed for it. Its simplicity will readily enable it to be managed by any ordinary mechanic who understands steam. Its construction is entirely within the means of our mechanics; it may be easily kept in order; with the exception of the shovel there can be but little wear attending its use; it can be worked on suitable land at almost any season of the year. The slight inequalities of the valley lands will prove no bar whatever to its use. In fact, it may be employed in any place where a furrow can he turned by an ordinary plow.

The employment of this machine is a direct substitution of steam power, the cheapest of all locomotive powers, for human power, the most expensive. We would call the especial attention of mechanics, ranchmen and all others interested, to this novel and interesting invention—another evidence of the progressive genius of California inventors.

A Sad State.—The Reese River *Reveille* says: The bodies of Francisco Flores and Rafael, a portion of the party who started out on an exploring expedition some three months ago, only one of whom escaped, an account of which we published, were found two weeks since about one hundred and ninety miles south of here. The bodies were entirely dried up, and there is no doubt but that they died of actual starvation. They were well known in this county, and one of them was the discoverer of the San Antonio District.

State Agricultural Society. — We acknowledge the reception of a complimentary ticket to the 11th annual Fair of the State Agricultural Society, to be held at Sacramento, October 17, 1864; also a neatly bound volume containing the transactions of the Society for 1863.

Sueing for Damages.—It is stated in a Solano county paper that a person named Pollock has commenced suit against the steamer Washoe for damages, for injuries received by the late explosion, and Deputy Sheriff Apgar on Thursday last attached the hull nf the ill-fated steamer.

CALIFORNIA MANUFACTURED WIRE AND WIRE ROPE.

We have incidentally referred to Hallidie's wire rope, in our review of the contents of the Pavilion of the Mechanics' Fair, but feel confident that further particulars of this important branch of our local manufactures will not be without interest to the readers of the Press.

The machine for the manufacture of wire rope and submarine telegraph cables, exhibited by A. S. Hallidie & Co., presents features entirely new, the arrangement of the bobbins containing the wire, being such that they have no motion other than that of unwinding. In the latest improved machine in use, the bobbins whirl around a center bobbin with a velocity so great that it is impossible to examine the them while in motion, and consequently the danger from forcing of the wire or disarrangement of the machinery is very great; this is entirely obviated in Mr. Hallidie's improved machine, as nothing but a light frame containing the bobbins and wire revolve, while the bobbins themselves can he examined at any time while the machine is in most rapid motion; the diameter of this frame is infinitely smaller than the diameter formed by the revolving bobbins in the ordinary machine, consequently there is less loss from atmospheric resistance.

The machine exhibited runs with a rapidity of 500 revolutions per minute, and at this velocity a boy can turn it; it will manufacturing 10,000 yards of strand per day; and it does its work complete and perfect, laying up the strand, measuring while working, and coiling up when made; the peculiar motion of the wires being lifted one over the other, and not being individually twisted around one another, is better understood by examination than could he by description.

The machine on exhibition sits on a frame 25 by 3 feet, is the smallest sized used by this firm, and was manufactured here under the direction of the inventor, Mr. Hallidie. They have machines of different classes capable of manufacturing wire and wire rope of all sizes to six inches in circumference, but this one they find the most successful and effective of any employed.

The manufacture of wire rope, important as it is, becomes still more important, when the material from which it is made is also manufactured here. This enterprising firm bave lately completed works for the manufacture of wire of all kinds, and they now furnish themselves with all the wire they use in their ropes. It will bo seen at once that this is an important item to the consumers of wire as they furnish at their mill an article free from rust or tarnish, and of any guage required; the loss from rust in importing wire being very great, and the finer the wire the greater the danger from this cause. Messrs. Hallidie & Co., employ in their business over sixty different kinds of wire. To keep a stock of so many sizes is impossible, the market being so remote they often run out in spite of all vigilance. Apart from their necessities, the erection of a wire mill is an important feature in our manufactures, and is one more assurance that we shall eventually be independent of importers in this connection, and for the good of the country we say God speed the day.

Tho samples of iron, copper and brass wire drawn at this firm's mill, is infinitely superior to any imported. Parties can see the difference by examination, as they have made articles and placed along side of wire imported from Massachusetts, England and Germany.

A New Thing in Manufactures.—Until very recently the art of weaving colored figures in silk fabrics has been entirely unknown among our domestic artisans. An enterprising firm in the East have, however, taken the initiative step in introducing the secret into the American manufactures. A few samples have reached this Coast in the form of Lincoln badges, with the portrait of the President woven in the fabric so perfectly that the picture looks like the print of a steel or wood engraving. The French, who have hitherto supplied us with this class of articles, will soon find formidable rivals on this side of the water.

Fully Due.—The steamer iron-clad gunboat Waterce, is now fully due and may he expected in the harbor at any hour.

MINING MACHINERY AT THE FAIR.

In our remarks on this important branch of the exhibition at the Mechanics' Fair, we unintentionally omitted to make as full a notice of the Novelty Works, a small portable prospecting quartz mill and amalgamator, as its very interesting and useful character so well deserved. This small institution in the presence of all who desire to see it, takes the ore from the pile, crushes, grinds and amalgamates it, while its proprietors, Messrs. Hopkins & Johnson, retort the product and make it into a bar of Bullion, we saw them take some very large masses of amalgam from their amalgamator, one weighing nearly 160 oz. from 475 lbs of rock taken from the Ella Frances claim at Aurora, and another of 171 ozs. from 94 lbs of rock taken from the Hope claim, Eagan Canon, Nevada Territory. If this little machine will effect so much, what will a large one of the same pattern not he able to do. This one at the Fair is but a mere toy, being capable of operating upon only about 100 lbs. We understand the proprietors of this most efficient machine are having one made capable of operating on 2,000 pounds of ore at a single charge. If this charge should happen to he of the Hope claim, it would require a good sized mule to pack off the bullion. These machines, the invention of Mr. Hopkins, a young mechanic of our own community, are not excelled by any in point of simplicity of construction, durability, and rapidity with which they perform their work of crushing, grinding and amalgamating.

The peculiarity of Hopkins' amalgamator consists in its being formed of a cylindrical case placed horizontally on legs, lined with plates or dies, which perform the operation of grinding, and which are very easily replaced when worn out. The muller may he described as an oblong section of a cylinder set obliquely on a shaft, extending the entire length of the cylinder. This muller is also covered with plates or shoes readily replaced whenever worn out. This shaft revolves in close fitting metallic boxes, also, an invention of Mr. Hopkins, a very important improvement, as it permits the mullers to obtain a certain amount of vertical play and keeps the pressure on the pulp the same at all points. The motion of this peculiar shaped muller imparts three distinct motions to the pulp and secures its thorough grinding. We strongly recommend all parties connected with mines and mills to examine Hopkins' Novelty Quartz Mill at the Fair.

Our New Sign.—Our neighbor of the *Flag* makes the following pretty notice of the new sign which we put up on Saturday last, over our Press at the Pavilion:—

The Proprietors of *The Daily Fair Press* have made quite an addition to their printing office in the Fair, by putting up a superb sign, painted by Mr. Mansell, on which are emblematical figures descriptive of the scientific character of the paper, drawn exceedingly well, and painted in colors. The name of the paper being painted in a peculiar text scroll letter, shaded to perfection.

A Descriptive Catalogue of the Mechanics' Fair is issued by Messrs. Dewey & Co., publishers of the *Scientific Press*. It is a well printed pamphlet of seventy-eight pages and presents a diagram of the Pavilion, and carefully prepared lists of the Exhibitors and all the articles of the Great Exposition.—*Golden Era.*

The London correspondent of the Philadelphia *Inquirer* says the unprecedented emigration to the United States is draining the British empire of the bone and sinew of the land. Manufacturers are beginning to tremble lest they will be unable to find hands to do work in their mills when they re-open them, and even farmers already lack common day laborers.

Another Dividend-Paying Copper Company.—The Laneba Plana Copper Mining Company, of Calaveras county, has declared a dividend of $87.50 per share on its capital stock, the proceeds of its first shipment of ore from its mine to New York. The ore yielded $66 per ton, and the average of the ore in the mine is from 14 to 20 per cent. Another shipment of ore, still better, prepared for market, is now at Stockton, and will go forward to New York without delay.

It is Impossible for editors to know ALL the merits and demerits of their correspondence, consequently the reader must not receive the opinions of our contributors as our own. Intelligent discussion is invited upon all sides and the evidence of any error which may appear will be received in friendship and treated with respect.

American and Foreign Patents.—Letters Patent for inventors can secured in the United States and foreign countries through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past year.

San Francisco:
Saturday Morning, Oct. 1, 1864.

☞ The Editors of the MECHANICS' FAIR DAILY PRESS assume no responsibility for the opinions expressed *over any mark or signature* in its columns. ☜

ESMERALDA CORRESPONDENCE.—We have received a tort communication from Aurora, touching the prospects of some claims and the management — or rather mismanagement of others, which we shall publish over the author's own signature next week.

ON OUR REGULAR BEAT AGAIN.—If any readers in the interior have become wearied by our continued reports of the Industrial Fair, we can assare them that after this week we shall resume oar usual variety of miscellaneous reading. The Exhibition all will admit has been a great and successful event to the State. To the proprietors of the MINING AND SCIENTIFIC PRESS it has proved expensive but highly beneficial, in the matter of increasing the importance of our journal and extending its reputation.

PROFESSOR J. D. WHITNEY, the State Geologist of California, has communicated a statement in regard to the Geological Sarvey of this State, to the *American Journal of Science* for September, which we will notice in our next issue. One item of great scientific interest, is his determination of the age of the gold-bearing rocks. He states, "while we are fully justified in saying that a large portion of the auriferous rocks of California consists of metamorphic triassic and jurassic strata, we have not a particle of evidence to uphold the theory that has been so often maintained, that all, or even a portion of the auriferous slates are older than the carboniferous; not a trace of a Devonian or Lilurian fossil ever having been discovered in California, or indeed anywhere to the west of the 116th meridian."

He states also that "the facts collected by this survey, when fully laid before the public, will justify the assertion that the mastodon and elephant, whose remains are so widely and abundantly distributed through California, have been contemporaneous with man in that region."

The late date at which this article has been received, prevents our noticing it more fully in this issue.

HAIR WORK.—One of the most attractive features in the Art Gallery of the Pavilion, is the fine display of hair work, formed into beautiful boquets and wreaths by the skillful and patient hand of woman; how provident and thoughtful! When the paint and canvass shall have crumbled into dust, and the almost speaking and imperishable marble shall have grown dingy and dim, these beautiful memeatos will remain untouched by the hand of time. We notice one of the most elaborately wrought specimens of this art is the one placed upon exhibition by Mrs. M. E. Woods, of this city, inclosed in a fine gilt oval frame, wrought into a wreath and basket boquet, showing the rose, the lilly, the tulip, and the blossom and fruit of the blackberry, and composed of the gray hairs of the grandsires long since departed, as well as that of the child, the youth and the middle aged, all commingled and interwoven into one imperishable wreath, to be handed down as an heirloom of the family tree.

EASTERN FINANCES.

The arrival of the steamer on Thursday, places us in possession of Eastern commercial advices to the 3d inst. per mail. The political situation of the hour at that date, promised to assume greater importance and more mysterious significance with the increasing agitation on the subject, rumors of peace and an early settlement of our national difficulties were freely circulated and discussed by all classes. The question of an armistice was already beginning to exert an influence in financial and commercial circles, and a rapid decline in gold and in the prices of all other commodities was predicted. There was no disposition showu in any quarter to commence new combinations for an advance. Stocks (other than Goverament) were all drooping, in spite of an easy money market, and lower prices were anticipated. We must remember, however, that in Wall street, the future is always being discounted, and coming events cast their shadows so long before, that the substance is sometimes finally lost sight of, while very often the shadow is very often a delusion and a snare. To add to the unsettled feeling produced by the agitation of reports leading to a cessation of hostilities, a rumor prevailed that the Secretary of the Treasury would soon place a new loan upon the market, which might for the time being, bring about contraction and curtailment when least expected. The sluggish ease of the money market was indicated by the bank statements. The common rate for loans was still 7 per cent., with occasional exceptions at 6 per cent. per annum. First class commercial paper was discounted at these rates, and ordinary at 8@9.

ABOUT CARPETS.—If you intend purchasing a carpet at any time during the approaching season, call into the establishment of Mr. WM. M. HIXON, on Clay street, when you are passing down from the Plaza, and examine his stock. Drop in at any time, as it makes no difference whether you are prepared to purchase immediately or not, you will have an equal facility of viewing the goods, and receiving courteous civility. It is well in selecting a carpet to see the various samples at different times, in order to fix upon such a pattern as will most permanently suit you best, and when a correct choice is made, the longer you use that carpet the more fondness you will have for it. Always remember, no matter what you are buying, that a good article which harmonizes with your taste is cheaper at a full rate than one you half dislike of poorer quality at half price. There is no more deceptive article in the market than carpeting, and many cheap patterns which at first look bright and of good weight are utterly worthless. In a well established house, in a central and permaneat location, like Mr. Hixon's, policy alone would dictate the exclusion of this latter material; and we assure our friends they may always rest satisfied of obtaining a good article at a reasonable figure at Nos. 606 and 608 Clay street.

CALIFORNIA ORNAMENTATION.—Few branches of the mechanical arts in the State have made more rapid and elaborate progress than the manufacture of California jewelry. The gaudy tinselry which has been manufactured by the bushel in the Atlantic States, until it has filled the civilized, as well as the uncivilized world, and become an eye-sore, as well as an ear-sore, to those who beheld it, as well as those who wore it, has been almost discarded from our market, while new and beautiful designs made from California gold and silver have taken the place of this stuff.

We notice among the most enterprising manufacturing jewellers of this city, the Messrs. Joseph Brothers, 607 Montgomery street. At their store can be found a beautiful and varied assortment of jewelry, with new designs pre-eminently of their own, together with diamonds and pearls. The Messrs. Joseph Brothers are, we believe, the only authorized agents of the celebrated Bohm's Ladies' Buckle, a California invention. These buckles are being adopted by ladies all over the civilized world.

THE FIRST SILVER BULLION FROM LOWER CALIFORNIA.

By the steamer John L. Stephens, from Mexico, which arrived a few days since, there came up from the works of the Triunfo gold and silver mining company thirteen bars of silver, weighing in the aggregate about 3,250 ounces, and of an average fineness of 914-1000, and their value $3,821. This is an interesting circumstance, from the fact of their being the first bars of silver ever melted in that country. There was much doubt expressed of the ability of the company to work the ores there, as nearly all the ores of the peninsula are what are called "rebellious," or, as the Mexicans call them, "*metal de fuego*," which have to be roasted, requiring skillful and scientific treatment. The company commenced work on their mine more than a year ago, having small lots of ore worked in this city, from time to time, to practically test the value of their mines. The great richness of the ore, together with the enormous expense attendant on having their ores treated in San Francisco, induced them to erect works of their own at the mines. They have just completed a fine ten stamp mill and four large roasting furnaces; they use the barrel or Freiburg process. This present result is mainly due to the energy and skill of Mr. Brooks, the secretary of the company, who is now down there, assisted by Mr. Youngjohaan, who is a graduate of the Saxony school of mines, and of course understands the Freiburg process thoroughly. This shipment of bullion is the yield of about forty-five tons of ore. Regular shipments of bullion are expected from this mine for the future. It is worthy of remark that no gold is found in the metal. This company has expended less than $90,000 since their commeacement, and every dollar of it has been judiciously and honestly laid out—where the shareholders can see the benefit of it. Mr. Flint, the President of the company, is indefatigable in his attention to its interests; and the best proof of the confidence of the shareholders in the good management of the affairs of the company is that at their annual meeting the entire board of trustees were unanimously re-elected.

HIGHTH OF VANDALISM.—Some miserable scamp has twice entered the skating pond saloon and out of sheer desire to do mischief, has persisted in turning the crank upon which those little automatic figures revolve, so violently as nearly to destroy them. This wretch should be sacked and with a pair of huge galvanized iron tongs, tumbled from one end of the Pavilion to the other, and dropped out of the *back door*.

A NEWLY INVENTED COFFEE STRAINER.—Schuster Brothers, No. 102 Kearny street, have just invented one of the most ingenious and efficient coffee strainers that has come under our notice. It is exceedingly simple in construction, but most effective in use, making the coffee as clear as brandy, without depriving it of any of its aroma, as is usually the case with coffee strainers. We commend to the notice of lovers of good coffee this new invention of Schuster Brothers, for which they are about to take out a patent, through our agency.

CORRECTION.—In the notice of Capt. Harrison's Pump, in our issue of yesterday, we spoke of its raising "a continuous stream of water 24 inches wide by 6 deep;" we should have written 25 by 7½—a slight difference of nearly one-third. We would further call attention to an important fact in connection with this pump, that the invention is something quite original, an application of an entirely new principle to the operation of pumps, as will be seen by examining the sectional illustration given in this paper. This pump has neither valves nor packing, yet it is both a suction and force pump.

A grand promenade concert and ball will be given by the Institute on Friday evening, October 9th, commencing at nine o'clock. The programme will be announced to the public in a few days. Tickets, admitting a single person, one dollar, which can be procured at the principal stores and hotels.

[From The Daily Fair Press of September 30.]

We condense the following from this morning's dispatches to the *Alta*:—

There are strong indications of another general movement of the Army of the Potomac. Gen. Ord's corps made an advance yesterday along the north bank of the Potomac, capturing 15 cannon, 300 prisoners and some strong fortifications. Birney also made a successful advance and was "on the road to Richmond" at last accounts. Lee has evidently been weakening his lines to help Early. Other important movements may be looked for at any hour.

Sheridan is still "marching on," driving the enemy before him. He has captured Staunton and Waynesboro. Deserters report that preparations are evidently being made to evacuate Richmond.

Jeff. Davis has gone to Georgia to look after the critical state of affairs in that region. Desperate efforts are being made to break Sherman's communications; but government feels no apprehensions of anything serious.

Forrest's raid into Tennessee has been suddenly checked by the activity of the Union troops.

In Missouri a large force of the enemy endenvored to take Shepard's Mountain, near Pilot Knob, by assault. The Union General Ewing met them gallantly, and drove them back with a loss of 1,500 killed and wouaded. Among the killed was the rebel General in command. General E., however, not feeling strong enough to hold his position against the reinforcements which might be brought up, subsequently evacuated the port and blew up the magazine. The Union forces in Missouri are concentrating preparatory to strike a crushing blow upon the rebel raiders.

This evening's dispatches to the *Bulletin* give further confirmation of the glorious news of the morning. Much activity is manifested in military matters both in Virginia and Missouri. Nothing decisive, however, has transpired later than what was given in this morning's dispatches.

Accident to the Chrysopolis.

Telegraphic dispatches to the *Bulletin* state that the steamer Chrysopolis run upon a snag on her up trip, about 2 o'clock this morning, just after leaving Steamboat Slough, and stove a large hole in her planking just abreast the pantry door. In spite of every effort to stop the leak, the water poured in with such force that when she got about a mile above Freeport she had to be run on the flats.

The latest accounts were that the water was over the tops of the seats in the dining cabin and still gaining, in spite of the pumps. The steamers were dispatched from Sacramento her assistance. The down passengers to-night, will be taken by a steamer to connect with the Stockton boat.

IN AID OF THE SUFFERERS.—The adjourned meeting in aid of the sufferers in the lower counties met at the Chamber of the Board of Supervisors last evening. Messrs. W. E. Lovett and W. J. Shaw were appointed a committee to visit the counties where the destitution prevails, enquire into the extent and character of the distress and report the earliest practical moment. A large number of gentlemen were appointed to act as permanent Relief Committee. A committee was appointed to visit the principle business houses in the city, with drays to solicit contributions of groceries, vegetables, etc.

F. J. Maguire, County Judge of Santa Barbara, Rev. James Vila and Mr. Shaw were requested to act as temporary distributing agents for the supplies forwarded to their several localities by the steamer Senator. A large amount of provisions have been collected, and they are still coming in. The permanent relief Committee will meet in this evening at the Chamber of the Board of Supervisors.

The receipts from the skating pond, yesterday, amounted to $25; from exhibition of mammoth cheese, $1, $12 25. Sanitary Fund chairman at door of the Pavilion yesterday were nearly $10.

Favorable to inventors.—Persons holding new important improvements, can have the same illustrated and explained in the MINING AND SCIENTIFIC PRESS without charge, if in our judgment the merit, and of sufficient interest to our readers to warrant discovery is one publication.

THE MINERS' FOUNDRY.

This is one of the most popular and most extensive foundry establishments in the State. Though its establishment is of quite recent date, the works have already assumed very large proportions. Extensive additions have been made to the buildings during the past season. A large addition has been made to the eastern end of the building, the upper portion of which has been fitted up for an additional pattern shop. A new moulding room has also been added. This firm employs 150 to 175 hands and consumes about seven tons of pig iron and one of bar iron per day. Up to the close of last winter they had for some time manufactured on an average one of Wheeler's pans per day.

This establishment is now overcrowded with work, mostly of a very heavy character. Among the work now in progress we noticed a 40-stamp quartz mill, which they are constructing for an English company located on the Truckee river. This mill is to be driven by a huge water overshot wheel, 21 feet in diameter and 28 feet breast. Twenty-four Wheeler pans are to be connected with the stamps. They are also constructing a mill for the Corderilla Company, Mexico, which will run ten stamps and use Wheeler's pans. They are also at work upon a 15 stamp mill for Mr. Joseph Woodworth, of this city, which is to be placed upon the Osborn Hill lead at Grass Valley, which mine he has recently purchased. This mill is to employ the dry crushing process of Wheeler & Hotulling, and will use Prof. Ryerson's Superheated Steam Process for amalgamating. They are also preparing pumping and hoisting works for a New York company, whose mine is located in Arizona Territory.

The heaviest and most important piece of work, however, on which they are engaged is the huge Steam Pump, for the Gold Hill Drainage Company. This pump will be driven by a cylinder 40 inches in diameter and 12 feet stroke. This huge cylinder will be placed endwise, directly over the mouth of the shaft. From the top, and connected with the piston rod, will extend three arms or lifters, which will work the same number of pumps, placed at intervals around the circumference of the shaft. The barrels for these pumps are now being cast at the Miners' Foundry, where the cylinder is also being prepared. The barrels are twelve feet long, corresponding to the cylinder, and of ten inches bore. One of them is now in the lathe. The casting is two inches thick of iron. It is calculated that these pumps will raise 500 gallons per minute, and will be able to drain the mine to a depth of 1,500 feet. Altogether the Miners' Foundry is a complete establishment, creditable alike to its proprietors and the city.

Among the specialities of the manufacturer of this foundry is Howland's Cylinder Amalgamator, which differs essentially from all others in use, and is in reality an improvement on the Freiberg Barrel, doing the work of that celebrated machine with greater celerity and, it is thought, more effectually. We give herewith an illustration of this machine. It is to be regretted that Mr. Howland did not put one of these amalgators in the Pavilion, where it would undoubtedly have attracted much attention.

THE CAMANCHE.—The laborers on the Camanche are now putting on the immense plates of outside armor, and the deck is nearly or quite timbered over. It is proposed to launch her in November next, and some of the Sanitary Commission people are canvassing the propriety of erecting a great ampitheatre to accommodate those who are willing to pay to see the operation.

LEASED.—We understand that the Executive Committee of the Mechanics' Institute have leased the Pavilion to the State Central Union Committee, for the sum of $2,000, from the close of the exhibition until after the Presidential Election. The Committee reserve the use of the Pavilion for the Grand Promenade Ball of the Institute, on the 8th of October, and for a Ball to be given by the Masonic Board of Relief on the 15th of October.

LEATHER AND ITS MANUFACTURES.

We presume very few of our citizens, previous to the opening of the Mechanics' Fair, had any adequate conception of the extent and importance of the leather production of California, and its manufactures. Twenty different entries have been made in this speciality, embracing nearly every variety of manufacture into which leather enters as a chief component. In our daily issue of the 26th inst., we made some brief illusions to several entries under this head.

The county of Santa Cruz, we believe, took the initiative in the manufacture of leather in California, and for a long time the article produced by her tanneries was the only really serviceable leather made in the State. Experience has proved that the live oak of the plains is not adapted to this manufacture, and recourse is now had, almost entirely, to the bark of the mountain oak, which has been proved to compahlo of making as good leather as can be made at the Eastern tanneries. Some varieties of mountain oak found in the Coast Range are found to operate fully as well as that obtained from the flank of the Sierra Nevada. Large quantities of bark are also obtained from the vicinity of Madera creek, some ten miles from the State Prison, in Marin county, for the Stockton tanneries, which is said to possess very superior chemical properties for his use. This bark is stripped from the trees immediately after they are felled, to preserve as much as possible its juicee.

We have no means of knowing the number of tanneries in the State, but judging from the amount of leather that is now consumed by our manufactures in that line there must be a large number. The progress of this manufacture has been slow, and was attended, at first by many failures. Experience, however, has taught us much in this matter which will be of good service to the State hereafter. Every particle of information on this and kindred enbjects is of great value, and we should be pleased to hear from any one who has made the business of tanning in this State a matter of careful study. The exhibition of the Mechanics' Institute will doubtless do much for the benefit of this as well as many other branches of industry, in collecting and diffusing information and laying open to our citizens and capitalists, new and valuable branches of industry. Every effort to stimulate manufactures in this State should be countenanced and encouraged by our prominent moneyed men. Manufacturing institutions are the great want of the State at the present time. They will do for us what veins of silver and gold never will. They will encourage and build up permanent communities, and furnish a regular and constant demand for labor, which many, who have become disheartened or disgusted with mining operations, will go abroad, to find if it is not furnished them here. That happy combination of mining, manufactures and agriculture, which is within the ready grasp of California, will lay for us a more sure foundation for a great and prosperous State, than any other people have had presented to them, since civilization began. Let us not neglect this more than golden opportunity.

MONDAY'S BENEFIT AT THE PAVILION.—The Exhibition of the Mechanics' Institute closes on Saturday evening, at which time the season tickets for admission thereto will expire. The managers of the Institute have generously resolved to open the Pavilion on Monday for the benefit of the sufferers by famine in the lower counties, and all the employees and the band have promptly tendered their services free for that occasion.

Notice of Dividend.—Office Crescent Quartz Mining Company, Indian Valley, Plumas County, California, Sept. 20, 1864.

At a meeting of the Board of Trustees of the Crescent Quartz Mining Company, held this day, a Dividend of Fifty Dollars per share was duly declared, payable October 1st, 1864, at the office of I. GLAZIER & BROTHER, 311 Clay street, San Francisco, or at the office of the company, Indian Valley, Plumas county, California.

14w2 d-I W. A. BOLINGER, Secretary.

Our Circulation.—THE MINING AND SCIENTIFIC PRESS has a large and permanent subscription list, and enjoys a more universal circulation among stockholders and persons directly interested in mining than any other paper on this coast.

USE OF THE WASTE STEAM OF LOCOMOTIVES. In France, the waste steam from the engine, instead of being allowed to escape into the air, is conducted from the escape pipe by means of a vulcanized India rubber tube, to copper pipes, through which it circulates under the seats and flooring of the cars. As soon as the train is set in motion, the steam begins to circulate through the pipes, and warms the cars, first, second and third class equally, and being connected with each other by India rubber tubing, they can be immediately detached or reunited at pleasure. In a trial of this plan on the Lyons line, two thermometers placed in first-class cars, marked sixty degrees Fahrenheit during the whole journey; and in the second and third-class cars also, the temperature was found to be sufficiently elevated to allow of the longest winter's journey being accomplished without discomfort to the travelers.

A THREE YEAR OLD SQUASH.—Just under the music gallery, at the Pavilion, and resting against the column which supports the winding staircase to the gallery, may be seen a very unpretending looking vegetable, known as the "Custard Squash." This squash was raised in 1861, and is consequently now three years old, and looks as though it might continue sound and healthy for an entire decade. A lady who was sitting near it assured us, of her own knowledge, that an excellent custard pie could be made from it, *without eggs*. Mr. D. L. Perkins, of Oakland, who raised it on his ranch, also claims for it the same excellence.

On the line of the Atlantic and Grand Western Railway, near Wooster, Ohio, the embankment and track lately disappeared in a most mysterious manner. Upon examination it was found that about a hundred feet of the road had sunk, and was continuing to sink, while into the cavity formed black mud, and heavy steams of water gushed from below. With the water there were thrown up a number of eyeless fish, still living. The sink is one of great depth, and considerable difficulty will be experienced in filling it.

Advertising Circular.

The Proprietors of the MINING AND SCIENTIFIC PRESS would call the especial attention of MINING SECRETARIES, TRUSTEES and SHAREHOLDES, to a few substantial reasons for the publication of Mining Notices in their journal—the first and only important newspaper of its class published upon this coast.

1st. The PRESS enjoys a large and permanent subscription list, having a more universal circulation among shareholders and men intimately connected with mining interests than any other publication.

2d. Under the present law the publication of all mining notices on Saturday, in a weekly journal, complies as fully with the statutes as a daily publication. It is generally found to be equally as convenient for secretaries, and decidedly preferable to stockholders who have not time to examine throughout every issue of a daily.

3d. Economy in mining should always be looked upon with favor, and the cost for weekly advertising in the PRESS is less by one half than the rates of any other journal in this city possessing a respectable circulation.

4th. The publishers of the PRESS, making the mining interest their especial care, take particular pains to assist in the avoidance of errors in advertising. Our print is also more clear and perfect than can be expected in such papers as are hurriedly issued from cylinder presses.

5th. Our "Shareholders' Directory" forms a complete index of all mining notices published in San Francisco, by reference to which shareholders can at once see if their company is advertised, and determine whether the same is inserted in the PRESS or some other paper.

6th. Many copies of the PRESS are bound by prominent professional men, mechanics, secretaries, brokers, shareholders and others, as an important record for future reference, thereby rendering advertising, of every class, in its columns, of peculiar and permanent value.

7th. The benefit of having all mining notices consolidated in one newspaper, for the common convenience of shareholders, secretaries, and others who have occasion to refer to the same, is obvious. With this view we have established our rates at only fair, living prices, believing that a journal like ours, untrammeled by party, creed, or prejudice, is the only medium which can reasonably ask for such a consolidation of mining patronage.

8th. Our rates are uniform as well as moderate. Advertisements will be taken from the forms and printed on slips or as circulars, for sending personal notification to stockholders, whenever desired, at $1 per hundred.

9th. Advertisements in the columns of the PRESS, after their first insertion, are arranged alphabetically. Our present list is equalled only in one instance by that of any other journal. Shareholders, as well as strangers, naturally turn their attention to a mining journal for information concerning the mines and mining matters.

10th. Blanks for filling out advertisements of assessments or notices of sale are furnished gratis. Our rates of advertising, and any other information desired, will be freely given upon application at the office.

LAST, BUT NOT LEAST.—Our sheet (having been recently enlarged to the size of Harpers' Weekly) is now only equalled in its dimensions by one mining paper in existence—the *London Mining Journal*. Published in this, the greatest mining field of the world, we desire that the PRESS shall have no superior. We can only realize our cherished object of building up a reliable advocate of the science and business of mining, which will be of just honor and profit to our community, by experience and liberal patronage. The bestowal of such favors only as naturally belong to us, and which it is clearly for the benefit of the mining fraternity to extend, is all that is requisite, and we are confident we shall receive it.

DEWEY & CO.,
Publishers of the Mining and Scientific Press, Nos. 56 & 57 Government House, Corner of Washington and Sansome streets, San Francisco.

MINING COMPANIES and others connected with the Mining interests of California, will find all possible desired information in the *Mining and Scientific Press* of San Francisco, which is an ably edited Journal, smartly handled, and well up to the times. The Mining Companies of California, are awake to the advantages of having their Mining Notices, comprising Assessments, Dividends, Elections, &c., concentrated in the advertising columns of one Journal, as we notice in the issue of the *Press* of May 7th, there are no less than seven pages of this interesting matter.—*U. S. Mining Journal, Railroad and Financial Advertiser, New York.*

When we are Sick.

It is now an established fact, that three or four of Brandreth's Pills are always beneficial, especially when we have a cough or cold; and in bilious and liver diseases their good effects are beyond all praise. When we feel weary, and out of love with ourselves and the world, one or two portions of four or five pills each, will restore our health and good spirits, because they purify the blood. Sold by all Druggists.

Allcock's Porous Plasters

Resolve and assuage pain by calling forth the acrid humors from parts internal, to the skin and general circulation. Thus, in many cases, positively evaporating the disease. Sold by all Druggists. JAMES LULL, M. D.

A MAGNIFICENT
LITHOGRAPHIC VIEW
OF THE
Mechanics' Fair Pavilion.
PUBLISHED AND SOLD BY
DEWEY & CO.,
GEORGE H. BAKER, Artist.

At the office of the "Mechanics' Fair Daily Press," entrance nave of the Pavilion, and at the office of the Mining and Scientific Press, corner of Washington & Sansome streets.

☞ *READ WHAT OTHERS SAY OF IT.* ☜

MECHANICS' FAIR PAVILION.—We have received from Dewey & Co., Patent Agents and publishers of the SCIENTIFIC PRESS, Government House, corner of Washington and Sansome streets, a finely executed lithographic view of the Mechanics' Industrial Fair Pavilion, on Union Square. The picture is mathematically correct in proportion, and will be valuable hereafter as a souvenir of the greatest industrial exhibition ever held in our city.—"Daily Alta."

We are indebted to the publishers of the MINING AND SCIENTIFIC PRESS for a copy of a very excellent engraving they have issued of the Fair building and the Fair grounds.—CALIFORNIAN.

LITHOGRAPHED.—The Mechanics' Fair building has been pictured in good style, by George H. Baker. We acknowledge the receipt of a copy. DEWEY & Co. are the publishers.—CALL.

VIEW OF THE MECHANICS' INSTITUTE PAVILION.—MESSRS. DEWEY & Co. have published a lithographic view of this building. Size, 12 by 19 inches. The workmanship does credit to Geo. H. Baker, the Lithographer. The dimensions of the Pavilion are 375 feet in length, breadth 220 feet; dome 108 feet high and 100 feet diameter, the area being 55,000 square feet. P. J. O'Connor Esq., is the Architect. We hope the sheet will prove highly remunerative.—ARGUS.

EUROPEAN
METALLURGICAL WORKS.
Bryant Street, Between Third and Fourth,
San Francisco.

THE Proprietors having recently added to this Establishment the latest and most approved Machinery for the Reduction and Testing of ORES of all sorts—either in large or small quantities—are prepared to test Ores by such process as may be ascertained best suited to their chemical character, after a careful analysis being first made. Assays, either in the humid or dry way, made of all Minerals. Also, Refining and Cupellation attended to.

☞ Particular attention paid to the Smelting of Copper and Silver Ores.

S. P. KIMBALL. J. R. MURPHY.

BUSWELL & CO.,
Book-Binders, Paper-Rulers,
And Blank-Book Manufacturers.
No. 509 Clay street and 508 Commercial street, between Montgomery and Sansome, San Francisco. 4v8-tf

Hepburn & Peterson's
AMALGAMATOR.

THE SUBSCRIBERS WOULD CALL THE ATTENTION of the Mining Public to their Reducer and Amalgamator, and also to their Separator for reducing and separating the mineral from

Gold and Silver Ores,

Manufactured and exhibited at the Vulcan Iron Works, Nos. 137 and 139 First street, San Francisco.

These machines secure to the Miner a more Expeditious and Perfect Reduction and Amalgamation, a less liability to accident and delay, and a greater amount of useful effect in proportion to the power employed to keep them in operation than any other machine now in use for producing similar results. This fact is attested to by their general adoption and preference at all the principal Reduction Works in Nevada Territory; among which may be mentioned the Gould & Curry Mill, the Silver State Reduction Works, Zephyr Flat Mill, Pioneer Mill, Eastern Slope Mill, Phœnix Mill, etc.

☞ This Amalgamator may be seen in operation at Knstel Bros. works, Bryant St. between 3d and 4th.

(Illustrated in the Mining and Scientific Press, April 9th, 864.) HEPBURN & PETERSON.

WHEELER'S
Amalgamating & Separating Pans.

IT IS ACKNOWLEDGED BY ALL WHO HAVE EXAMINED the principles and witnessed the operation of these Pans, that they are decidedly superior for triturating and amalgamating purposes to any other in use.

The most important principle connected with the operation of these Pans is the separation of the triturating process from that of extracting the amalgam from the sand.—The chief cause of loss of the precious metal arises from the passing off of the same in combination with the quicksilver, during the process of trituration, and in cleaning up. By the introduction of the Separating Pan to follow the triturating, this loss is entirely avoided. In working these machines there is no appreciable loss of quicksilver, and hence none of the precious metals.

Where these Pans have been introduced and operated by the side of others on sands from the same vat, the Wheeler Pans have uniformly gained a large percentage of metals, over its competitors, as well as a still larger percentage in the amount of work performed.

*** These Pans may be seen in daily operation at the Miners' Foundry, on First street, San Francisco, where all interested are invited to call and examine for themselves.

no16-tf ZENAS WHEELER

PROGRESS OF AMERICAN INVENTION.

This is a theme so almost universal in its details that even the many large volumes of records in the archieves of the Patent Office at Washington, convey but an outline, or rather selections from. For these huge volumes containing hundreds of thousands of new inventions, distinct and different from all preceding inventions recorded—while there are all around us evidences of the progress of the spirit of invention, such as the application of old powers to new purposes, and of new materials to old purposes, to be seen in every section of our broad dominions which pass unrecorded, we shall only refer to the countless forms of manufacturing machinery, the manufactures of india rubber, paper made from corn husks, the extracting oil, spirits, dyes, perfumes and new illuminating agents from coal, as suggestions to the reader to lead his thoughts into the opening of the broad vista the theme affords.

Our present purpose is to point out the progress of American invention as exhibited by the one article of pumps at the Mechanics' Fair. There is not a man living at the present day, but what can remember the toil, time and risk that in his youthful days attended the obtaining a supply of water on the old farm on which he was raised. The cumbrous well sweep, with its wet and slimy chain and rope, or the rattling windlass with its death dealing crank, by which to obtain a drink of clear cold water from the well, one had to perform real hard labor. These things have all passed away before the progress of American invention, even the old chain pumps that were in their day considered as the greatest and most useful of labor saving machines, have been superseded by inventions as far superior to them as they were to the old sweep or windlass.—Look for instance at the Stannard Rotary lift and force pump on exhibition, which, by means of a cylinder not much larger than a common saucer, and a crank that a child three years old can turn with ease, will lift 2,000 gallons of water an hour from a depth of fifteen feet, and force it up fifty feet, or through fifty feet of hose; and such a machine selling for $30. Or look at the Hudson pump, with the old fashioned lever handle, which is constructed on the most simple of scientific principles, at the least possible expenditure of labor, throws a powerful stream of water so continuously and steadily that the falling water is as round, clear and compact as an icicle; a one horse power engine could work a thousand of such pumps. Or look at the operations of the wonderful pump invented by Capt. Harrison, which, by means of a smooth iron revolving in a peculiar manner within a small cylinder not over two feet in diameter, raises a continuous stream of water twenty-four inches wide by six inches deep—a perfect deluge pump. Those of us acquainted with the character of pumps for raising large bodies of water, as constructed not more than twenty years ago, must be astonished at the power of this pump, considering the the smallness of its size. As a case in point, we refer to the pump made by an English company to drain the well-known lake of Harlem, only a few years ago, this pump weighed nearly 200 tons, and cost nearly $100,000, and its full power was calculated to raise seventy tons of water fifteen feet in a minute. A pump constructed on the plan of Capt. Harrison's, weighing one ton and costing about $1,500 could perform the same work! This we consider a striking evidence of the progress of American invention in the article of pumps. But the most positive and crowning proof of this progress, of our superiority over all other countries in the world, is certified by the beautiful little pump exhibited by Mr. Hansbrow, its inventor—the very identical article that gained the World's Medal over more than three hundred competitors from all nations.

NEW ENGLISH COINAGE.—There is to be an alteration in the English silver coinage. It is intended by the government to recall, during the coming fall, the whole of the silver coins now circulating throughout the United Kingdom, and replace them by an entirely new coinage.

VULCAN IRON WORKS CO.,

[ESTABLISHED 1850.]

No. 137 and 139 First Street.

IRON FOUNDERS, STEAM BOILER MAKERS AND

STEAM ENGINE BUILDERS.

THE Machine Shop possesses the greatest number and the largest dimentions of Tools in the State. They have Laths to turn nine feet in diameter and thirty feet long. Their other facilities for executing work rapidly and efficiently are unsurpassed. Upwards of 300 STEAM ENGINES, made at their own Works, are now running in this State and Oregon, in Steamboats, Quartz Mills, Saw and Flouring Mills. Their BOILER WORKS have turned out upwards of 600 STEAM BOILERS of all kinds.

MACHINERY

Quartz Mills, Flour Mills, Hydraulic and other Presses, Hoisting Machines, Gearing Pullies, Gudgeons, Boxes, Hangers, etc., in Great Variety.

Quartz Stampers, Shoes & Dies,

Warranted to be made of the very hardest and toughest Iron.

RAILROAD MACHINERY, LOCOMOTIVE, CARS, CHILLED WHEELS AND TIRES, ETC.

A Published list of the Patterns of these Works will be sent on application.

MANUFACTURERS OF

JONVAL'S TURBINE WATER WHEELS,

The Cheapest, most Portable and Effective Machine ever invented for the application of Water as a Motive power. These Wheels are made entirely of Iron, simple, and not liable to get out of order.

☞ A DIPLOMA was awarded to this Company for the *Best California-Made Steam Engine*, by the Mechanics' Institute, September, 1857. 13

IMPORTANT DISCOVERY

— IN THE —

Photographic Art.

Jacob Shew's

CHROMATIC PROCESS OF PRINTING PHOTOGRAPHS.

[PATENT APPLIED FOR.]

THE UNDERSIGNED WOULD ANNOUNCE TO THE public that he has discovered a new and IMPROVED PROCESS of printing Photographs, which produces a

SOFTNESS, CLEARNESS AND DELICACY OF TONE

unattainable by any other known process and to which he has given the above name. It is applicable to any size of Photograph, and those having valuable old negatives which they desire printed by the improved process can do so at any time.

In order to secure the pecuniary advantages to be derived from this important discovery a patent has been applied for. When obtained, the privileges of the right will be disposed of at a reasonable rate to any Photographer desiring it. In the meantime all are warned against encroachments upon the rights of the discoverer as such will be prosecuted to the full extent of the law.

"Cartes de Visite" and large Photographs printed by this process will be furnished at the prices of the ordinary work of other establishments.

☞ The public are invited to examine specimens at my Gallery. ☜ **JACOB SHEW.**

STILL IMPROVING!

VOLUME IX
—OF—
The Mining and Scientific Press
COMMENCED
ON THE FIRST OF JULY, 1864,
WITH
An Enlargement of Its Pages.

Sixty-Four Columns in Each Number.

PUBLISHED EVERY SATURDAY.

The PROPRIETORS of this useful and now important journal experience much satisfaction in returning acknowledgements to their ardent friends and rapidly increasing patrons who have substantially contributed to the remarkable success of the PRESS during the past six months. By aid of the CIRCULATING PATRONAGE now being properly bestowed upon the

ONLY TRUE MINING AND MECHANICAL MEDIUM

upon this Coast, we are enabled to prove our appreciation of such marked favor by rendering the public one of the

Largest, Handsomest and Most Useful

journals now published. With this view we shall exert our best energies, and continue to make the MINING AND SCIENTIFIC PRESS substantially

An Instructor to Prospectors,
An Economist to Millmen,
An Assistant to Active Miners,

An Economizer for Mining Advertisers,
A Reliable Reporter for Shareholders,
A Faithful Monitor for Stockdealers,

An Intelligencer for Mechanics,
An Incentive to Inventors,
A Reflector for Patentees,

And a Helpmeet to all Industrial Classes,

in fact, upon the Pacific Coast. We shall give accurate and frequent

DRAWINGS AND ILLUSTRATIONS

of new inventions and discoveries of particular value to Miners, Mechanics and Manufacturers, their interests in this community being well considered "one and inseparable."

REPORTS OF THE MECHANICS' FAIR

Will form a feature of Volume IX, as we intend to give a careful description of all new inventions exhibited.

THE SHAREHOLDERS' DIRECTORY

Will comprise a record of all Notices of Meetings of Mining Companies, Notices of Assessments, amounts levied, date of advertising sales, and day of sales, announced in all advertisements appearing in the San Francisco papers during the period of the Volume.

STATISTICS FOR REFERENCE

And Reports of Elections of Officers of Mining Companies, Stock Reports, Valuable Tables, etc., will be continued with careful attention.

OUR PATENT AGENCY

is increasing in importance and value to the Inventors of the Pacific Coast, as many Patentees can testify from their successful applications through us during the past twelve months.

FOR SENDING ABROAD.

As a paper for mailing regularly to your friends in the East, or to correspondents elsewhere, none can be selected more appropriate, or better calculated to dispense reliable information with regard to transpiring events on this coast and the progress of California.

Specimen copies will be sent free to those desiring to examine the paper before subscribing. Postmasters, Express Agents and News-dealers, acting as our agents, will receive liberal commissions.

Friends pleased with our efforts in the publication of the PRESS can render us essential aid by furnishing correspondence and all important information which may come under their observation, and by calling the attention of their neighbors to the commendable features of the paper; the appreciation of which favors will be duly manifested by the constant improvement of our journal.

SUBSCRIPTION IN ADVANCE.

One Year, (two volumes)..... $5.00
Six Months, (one volume)..... 3.00

FOR ADVERTISING

Our terms are very reasonable. MINING COMPANIES are especially favored by our rates, and careful attention is given to the publication of MINING NOTICES.

Office in Government House, Nos. 56 and 57, corner of Washington and Sansome streets, San Francisco.

DEWEY & CO., Publishers.

O. W. M. SMITH.....W. B. EWER.....A. T. DEWEY.

For Advertising Assessments on Saturdays.

Levy your Assessments upon any day EXCEPT FRIDAY.

Advertise the ASSESSMENT NOTICE on the FIRST FOUR SATURDAYS succeeding the day upon which the assessment is levied.

Appoint the day for advertising the DELINQUENT SALE on the FIFTH SATURDAY succeeding the date of levying the assessment.

Appoint the DAY OF SALE on the SEVENTH SATURDAY succeeding the date of levying the assessment, or any day previous to the Eighth Saturday.

Assessments ordered upon Saturday afford the Secretary the longest term in which to effect his advertising at the mine.

Extracts from the Statutes.

The attention of companies who desire advertising their delinquent sales in any other paper than that in which the notice of assessment appears, is called to the following section of the law approved April 4th, 1864:

Section 7. If any portion of the assessment mentioned in said notice shall remain unpaid on the day specified therein for the publication of the notice of sale, the Secretary shall, *unless otherwise ordered by the Board of Trustees*, cause to be published in the same papers in which the notice provided for in section five shall have been published, a notice substantially as follows, &c.

If, from a matter of convenience or necessity, the publication of an assessment is delayed, a very simple remedy is found in the following section of the law, relating thereto:

Section 14. No assessment duly levied shall be rendered invalid by a failure to make proper publication of the notices hereinbefore provided for, nor by the nonperformance of any act required to be performed in order to enforce the payment of the same; but in case of any substantial error or omission in the course of proceedings for collection, all previous proceedings, except the levying of the assessment, shall be void, and publication shall be begun anew.

HUNT'S IMPROVED WIND-MILL.

THIS WIND-MILL IS RAPIDLY taking the place of all other Mills on the Pacific Coast. These Mills are so simple in their construction, that when once built, they can be put in order by almost any person; and when once in order they will run for years without repairs.

Prices, from $50 to $1,000.

ROUND AND SQUARE WATER TANKS BUILT TO ORDER.

HUNT'S PUMPS

Are admitted to be the best in the Market for Wind Mills, being built expressly for that purpose. They can be set, and taken apart with a common wrench, and are very easily repaired.

HUNT'S ENDLESS CHAIN

HORSE POWER

For Sawing Wood.

ALSO, THE

Self-Regulating Horse Power

Is so arranged as to give a steady motion, and is calculated to be used for turning Wood, Iron or Brass, also for Scroll or Circular Sawing, and is fully equal to Steam for any light work. The above Machines are built of the best materials, and made as Durable as Wood and Iron will make them.

ALL WORK WARRANTED.

☞ For further Particulars see small circulars. ☜

Disney's Cylinder Amalgamator.
The Cheapest and Best.

DISNEY'S CYLINDER AMALGAMATOR, WHICH HAS recently been introduced to the public, has already been proved a complete success, and can be furnished, at a price cheaper than any other in use. It is simple in construction, and so arranged as to do a large amount of work with the smallest expenditure of power. The proprietor is satisfied that he can do more work in a given time and with a given expenditure of power than any other amalgamator in use. For small companies who desire cheap yet effective machines, none can be more desirable.

It may be seen in operation at the Rail Road Foundry on Fremont street where

A NEW CRUSHER

Is in operation and he can crush and Amalgamate at the LOWEST RATES. Miners and all others interested are invited to call and examine for themselves.

M. DISNEY, Patentee.
San Francisco, June 23, 1864. 1-3m

PRATER'S

PATENT CONCENTRATOR.

THE PROPRIETORS OF THIS NEW CONCENTRATOR, having completed arrangements for its manufacture at the Fulton Foundry, in this city, now offer it to the public, with the fullest confidence that for the purpose for which it is designed

It Has No Equal in Use.

The principle of this machine, which is designed for a Concentrator exclusively, is entirely new. It is designed for separating finely divided quicksilver, amalgam and gold from the sands, and for concentrating and saving the sulphurets, and is to be placed behind all or any other machine in use.

This machine is now running on waste sands, from which it is taking out an average of 3½ pounds of quicksilver for each ton of sand. Orders or letters of enquiry may be addressed to

WANTED,
Gold Quartz suitable for Cutting Jewelry.
By FRONTIER & DEVIERCY.
437 Pine Street, San Francisco.
au31tf.

To Quartz Miners.

ALL PERSONS INTERESTED IN MINING MACHINery are invited to call at the Pacific Foundry and examine my improved Amalgamator. It is unquestionably superior to anything now known for amalgamating Silver and Gold. It works 1000 pounds at a time, and will amalgamate over three tons a day. By the motion of the revolving muller, the pulp is drawn through its center and passes under it, between the grinding surfaces, to the circumference; from whence it passes again over the muller to the center, through the holes and between the grinding surface to the circumference as before. Thus a constant circulation of the pulp is kept up, bringing the particles of ore again and again under the muller, and reducing the whole mass to an impalpable powder.

No quicksilver lies between the surfaces to be ground, but at the circumference and center of the pan where the metal must pass through it as the pulp circulates.

A patent was granted for this Amalgamator in December last, and all persons are again warned against purchasing machines made at the Miners' Foundry, called "Wheeler's Amalgamator," as they are an infringement on my patent, and a suit is now pending in the U. S. Circuit Court against the parties infringing. My Amalgamator can be seen running at the Pacific Foundry, where all can judge of their operation and the very superior style in which they are being manufactured. THOMAS VARNEY.

ASSAYERS.—The excitement raging in mining stocks for some two years had the effect to raise to the surface a surprising number of mushroom assayers, who no doubt proved the means of ruining hundreds of industrious persons by the allurements their ignorant or false returns set up. The money spent in this city alone for such miserable tests, during the past few years, would suffice to prospect a large field of rich claims. To avoid all foolish outlay in the matter of assaying we would advise our friends to choose some well established, reliable assayer, whenever they desire an analysis of their ore, and then when the results are given they will feel a measure of satisfaction, whether the work is reported good or bad. As one of the best chemists and assayers of San Francisco, we have no hesitation in mentioning the name of Gideon E. Moore, 334 Montgomery street.

A WORD TO THE NEWLY WEDDED.—Commence your new life with a fixed determination of having everything surrounding your happy home of a good and substantial texture and an embellishment of finish which shall continue in harmony with the glowing spirit of your double lives. To accomplish this, you must commence at the basis of your home with a good *understanding*, and purchase one of those superior, thoroughly made, but not extravagant, carpets, sold by KENNEDY & BELL, on the southwest corner of California and Montgomery streets. They have also a full assortment of other articles to match. Buy your goods at Kennedy & Bell's, and you'll not get cheated—be virtuous and you'll be happy.

I. S. VAN WINKLE & CO.,
Iron, Steel and Coal,

A. S. HALLIDIE & CO.,
Wire Drawers
AND
Patent Wire Rope Manufacturers,
[WORKS, NORTH BEACH.]
OFFICE, 412 CLAY STREET, SAN FRANCISCO.

ARE constantly manufacturing every length and size of ROUND AND FLAT WIRE ROPE, for mining, shipping and general purposes; being lighter, stronger, more durable and cheaper than hemp or manilla ropes, and is not affected by atmospheric changes. We claim for it the following advantages:

It is FIVE TIMES the strength of the same size hemp rope.
It is only ONE SIXTH THE BULK for equal strength " "
It is one half the diameter for equal strength " "
It is 35 PER CENT. LESS WEIGHT for equal strength " "
It is FIVE TIMES AS DURABLE.
It does not stretch or shrink in dry or wet weather.
It is not injuriously affected by the heat of summer or cold of winter.
It does not absorb water, and double its original weight.
IT IS AS PLIABLE AS HEMP rope of equal strength. For instance: A wire rope 2½ inches in circumference weighing 87 lbs. per 100 feet, equals in strength a hemp rope 6 inches in circumference, weighing 130 lbs per 100 feet.

WIRE SASH CORD.

We are also manufacturing Iron and Copper Wire Sash Cords, which over the ordinary cord combine all the advantages of wire ropes over hemp. Wire rope has been in use in California for MINING and FERRY purposes for nine years, and we can refer to companies in every part of the State, who have had it in successful and economic use.

WIRE DRAWING.

We have lately completed a WIRE MILL, and are now manufacturing all the Iron, Copper and Brass Wire used in our ropes, and are prepared to execute limited orders for wire for our customers; guaranteeing to furnish them at our mills a clean article of any size, free from rust, and equal in quality to any imported, and on as favorable terms

SUSPENSION BRIDGES AND FLUMES.

We have been engaged in the erection of Suspension Bridges and Flumes for nine years, and refer those interested to the numerous works of this character erected by us in almost every part of this State, Oregon and British Columbia, of span varying from 200 to 400 feet.

We have published a pamphlet entitled the "Mechanical Miner's Guide," containing scale of weights, strength and prices of wire-ropes, with other useful data appended, which we forward free by mail, and which can be had on application from any of our agents in the interior. 7

JENKINS'
Power Sheep Shearer.

The most valuable labor saving Machine ever introduced for shearing sheep. It must be seen to be appreciated.
A practical business man wanted to take an interest in the manufacture and sale of the same.
The Machine is on exhibition at the Pavilion.

WM. SHEW'S
PHOTOGRAPHIC GALLERY,
Photographs, Ambrotypes and Melainotypes in every style of the Art, and satisfaction guaranteed.
No. 423 Montgomery Street.

Miss Julia Jenkins.
BY E. I. BARRA.

She is
All that painting can express,
Or youthful poets fancy when they love,
[*Rowe's Fair Penitent.*

In the famous Golden City that o'erlooks the Western Ocean,
Where those Monarchs Wealth and Fashion, exert their sov'reign sway,
Dwells a lady of wondrous beauty, who excites profound devotion
In the hearts of all the bachelors, alike the grave and gay.

Her cheeks are like the roses that unfold their leaves each morning,
To greet with smiling welcome the life-imparting sun;
And Nature's fine arch'd pencilings her classic brow adorning,
Impart a power to her eyes to melt a heart of stone.

Her head, a fitting model, of grace and queen-like carriage,
Displays luxuriant ringlets of waving glossy hair;
The whiteness of her neck no vain critic can disparage;
Her hands are plump and dimpled, charming soft and fair.

What causes so much loviness? her neighbors often wonder
Where one who was so plain before, derives such beauty from?
They may dispel their doubts, for the mystery holds no longer;
Miss Julia's daily toilet wash is PURE NEW ENGLAND RUM.

Do you want a good head of Hair? Then wash it with pure New England Rum.
Do you want a brilliant complexion? Then wash your face with Pure New England Rum.
Do you want to eradicate Eruptions and Freckles? Then wash with Pure New England Rum.
Do you want to preserve a youthful appearance? Then saturate a towel with pure New England Rum, and apply the same daily to your face, instead of water.
Experience has fully demonstrated that New England Rum is the best Toilet Wash in the World. It is a sure preventive of Wrinkles. It is peculiarly adapted for use in this climate.

CAUTION!

☞ There is as much difference between Pure New England Rum and its counterfeit, composed of reduced alcohol as there is between genuine gold and galvanized brass fillings. New England Rum and Alcohol are both colorless fluids, but there all similarity ceases; for, while New England Rum beautifies and rejuvenates, Alcohol parches the skin, wrinkles the face, and ruins the complexion. The advertiser imports the New England Rum direct from Boston, Mass., and offers it for sale at the reasonable price of **50 cts. per Quart Bottle.** Each bottle is marked with the name of E. I. BARRA,
No. 118 First St., corner of Minna Street, San Francisco.
An extensive assortment of Bottled Liquors, suitable for Family use, constantly on hand.
N. B.—To each bottle of Pure New England Rum add one-third of a bottle of water; it is then ready for use. 2-df

JACOB SHEW'S
PHOTOGRAPHIC GALLERY,
315 Montgomery Street, near Pine.
The public are especially invited to notice the superiority of my "*CARTES DE VISITE*," exhibited in the Fair, over all others. My Photographs are printed by the
"Chromatic Process,"
an improvement which produces a superiority in my work unattainable by any other process. 1-d

THE
WHEELER & RANDALL
Grinder and Amalgamator.

The attention of the Public is respectfully called to these facts:
1st. That the Mechanical work accomplished by differently formed grinding plates, having the same diameter, weight, hardness, and revolving at the same velocity, is as follows, to wit:
The Mechanical work of plane, circular plates of the usual ring form, is ninety-eight.....98.
The Mechanical work of conical plates of the most approved form, is one hundred and ten.....110.
The Mechanical work of Tractory formed plates, as introduced in the invention of Wheeler & Randall, is one hundred and seventy-seven.....177.
That is, the Tractory formed grinding plates will reduce one hundred and seventy-seven tons of ore, the conical grinding plates one hundred and ten tons, and the plane circular grinding plates ninety-eight tons, to the same degree of fineness in the same time.
2nd. That as a whole, the Wheeler & Randall Grinder and Amalgamator is more simple, compact, substantial, convenient, efficient and cheaper than any other Pan in use.
Manufactured at the Golden State Iron Works, Union Iron Works, and Miners' Foundry.
WHEELER & RANDALL, Inventors.
San Francisco, Cal., Sept. 6th, 1864. (7)

GREAT TRIUMPH
—OF THE—
FLORENCE!

We, the undersigned, have each purchased a FLORENCE SEWING MACHINE and have them now in use.

We have thoroughly tested them on work of all grades—heavy, medium and light—and our opinion is that the Florence is durable, will not easily get out of order, is strong and simple in construction, and its use is easily learned by the most inexperienced.

It will do a greater range of work, with less trouble and change, and we consider it altogether better than any other Family Sewing Machine we have ever seen:

Mrs. Dr. Chase, 31 Turk street, S. F.
Mrs. D. B. Coffin, 20 Clay street, S. F.

John Herzinger, Nevada City.
H. Mackie, Nevada City.
P. Brunstiter, Grass Valley.
O. C. Shorey, Seattle, W. T.
D. Horton, Seattle, W. T.
Henry Jackson, Watsonville, Santa Cruz co.
Mrs. Albert Bader, San Andreas.
Mrs. Newton Damon, dress maker and tailoress, Seventh street, between Bryant and Brannan, San Francisco.

Previous to purchasing the Florence I owned the Howe Sewing Machine.
MRS. J. CRAWFORD,
Copperopolis, Calaveras county, Cal.

I used the Sloat Eliptic Machine six months previous to purchasing the Florence.
MRS. MARY CAFFEY,
Dressmaker, 16 Post street, San Francisco.

We, whose names follow, owned and used the Grover & Baker Sewing Machine previous to purchasing the Florence:

Mrs. Mary A. Merchant, dressmaker, 810 Stockton street, San Francisco.
Mrs. B. Weller, dressmaker, 406 Dupont street, San Francisco.
Mrs. Chas. Uzuay, 419 Bryant street, San Francisco.
E. A. Love, Angel's, Calaveras county, California.
Mrs. M. J. Roberts, 646 Howard street, San Francisco.
Mrs. L. H. Bayley, Portsmouth House, San Francisco.
Mrs. Julia Lyons, Target street, near Tehama, San Francisco.
Mrs Harriet Howes, 625 Post street, San Francisco.

We, whose names follow, owned and used the Wheeler & Wilson Sewing Machine previous to purchasing the Florence:

Mrs. J. D. Blain, Hubbard street, near Howard, San Francisco.
Mrs. D. S. Ruggles, 414 Folsom street, San Francisco.
Mrs. M. Young, 211 Stockton street, San Francisco.
A. M. Flint, C. L. Flint, San Juan, Monterey county, Cal.
Mrs. C. P. Jackson, El Dorado, El Dorado county, Cal.
Mrs. C. L. Taylor, 512 Dupont street.
Mrs. Sarah E. Miller, Sacramento.
Mrs. A. Nash, corner Stevenson and Third streets, San Francisco.
Mrs. Thomas Mitchel, Mokelumne Hill, Calaveras county.

The following named persons owned and used the Singer Sewing Machines previous to purchasing the Florence:

Mrs. A. J. Turner, 320 Beale street, San Francisco.
Mrs. H. B. Osborne, 612 Powell street, San Francisco.
Mrs. Annie Dailey, Bush street, below Stockton, San Francisco.
Augustus Brown, 134 Sutter st., San Francisco.
Mrs. F. Scherb, 673 Mission street, San Francisco.
Mrs. Sarah P. Viek, dressmaker and seamstress, 109 Stevenson street, San Francisco.

I have found the Florence to be all that I anticipated. It has never been out of order, nor ever has "spells," like most machines of other manufacture, several of which I have owned. I can conscientiously recommend the "Florence."
Mrs. ALBERT BADER.
San Andreas, May 17, 1864.

The Testimony of all purchasers of the Florence is but a repetition of the opinion of the few whose names are given above.

As our competitors have not deemed it advisable to exhibit their machines at the present Fair, to be tested by the side of *The Florence*, and as there are many strangers in the city, who contemplate purchasing sewing machines, who prefer (and we earnestly request them to do so) to see and compare the merits of all before they make their selection, we give below, for their convenience, the location of the principal Sewing Machine Offices in the city.

LOCK STITCH MACHINES.

Wheeler & Wilson's, office, corner Montgomery and Sacramento streets.
Singer's, 139 Montgomery street.
Ladd & Webster's, 32 Montgomery street.
Howe's, 3 Montgomery street.
Williams & Orvis', corner Jackson and Battery streets.

CHAIN, LOOP, AND "EMBROIDERY" STITCH MACHINES.

Grover & Baker's, office, 329 Montgomery st.
Folsom's New England, 8 Montgomery street.
Little Giant, 3 Montgomery street.

Parties who have not had the opportunity to thoroughly examine the Florence at the Pavilion, owing to the crowd of people gathered around the machines, will please call at Sales Room 111 Montgomery street and test them at their leisure, and until perfectly satisfied whether what is claimed for them is true or not.
SAMUEL HILL,
General Agent for the Sale of the Florence on the Pacific Coast.

MRS. C. M. CHAPMAN'S
Celebrated Vegetable Hair Dye.

THIS Coloring for the Hair is guaranteed to effect its object in the most perfect manner, without injury. Being composed of a vegetable Seed, it has a tendency to promote its GROWTH and STRENGTH.
It contains no mineral substance as other Dyes. Batchelor's and all other Dyes known are composed of, or from, Nitrate of Silver. This has no such substance. Specimens of Ladies' Hair colored can be shown to the satisfaction of any one. No. 687 Market Street. 10v9-1df

ASTROLOGER.

GO and see the Natural Gifted Astrologer, PROF. COHEN, 530 California street. He can give you true information as to the Past, Present and Future on Business Affairs, Law Suits, Matrimony, Love, Absent Friends, Sickness, etc. He tells the events of your whole life, and how to avoid trouble. A large number of people have been benefitted by his knowledge. As an evidence of his reputation he has received upwards of 16,000 consultations here in San Francisco.
N. B.—When personal consultation is had will not be necessary to give the age. Office hours, 8 to 12 M., and from 2 to 9 P. M. Consultation, $2; by letter, $3 with Chart. Sickness will be discovered and cured through science only known by him. 1-df

Illegal Advertising!

We notice many Secretaries are having their notices of delinquent sales published *weekly* in a *daily* paper. As this is a plain violation of the new law we feel it our duty to warn such parties of this error, and herewith append that section of the "Act Concerning Assessments upon the Stock of Corporations," which governs the publication of delinquent notices.

Section 9. Said notice, when published in a daily or weekly paper, or in both, shall be published as follows: When published in a daily paper, the same shall be published for a period of ten days, excluding Sundays and holidays, previous to the day of sale. When published in a weekly paper, the same shall be published for two weeks previous to the day of sale, the first publication in the weekly being at least fourteen days prior to the day of sale.

By the above extract it will be clearly seen that no delinquent stock can be legally sold by advertising in a daily paper, unless the notice is inserted *daily*.

If your whole income depended on a household Estate held by you only during the life of another, and which would be lost by his death would you not be anxious to insure against so heavy a contingency. Take the parallel, yourself the frail tenement or house of clay, your family and friends depeading *on your life* for their income, and its loss their most fearful calamity. It would be the *loss of their whole Estate.* Will you then delay to insure against so terrible a risk.

Our Patent Agency.

The PATENT AGENCY of the MINING AND SCIENTIFIC PRESS has been signalized with remarkable success during the past two years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of LETTERS PATENT from the United States and foreign Governments cannot be over-rated, and the Proprietors of the PRESS, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and and responsible agency upon this coast.

For Sending East, no more valuable or appropriate publication can be selected than the MINING AND SCIENTIFIC PRESS. For sale by the principal news agents.

THE GOLDEN ERA,

Founded in 1852.

The oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent, and correspondents of distinguished ability in New York, Paris and London.

THE GOLDEN ERA is now enlarged by the addition of eight columns to its pages—and presents fifty-six columns containing the greatest possible variety of Valuable and Entertaining, Original and Selected Matter, all combining to render THE GOLDEN ERA a Literary and Family Journal of surpassing interest and attraction; a Welcome Guest in Cottage and Cabin; the favorite at the fireside in City and Country, the most useful, agreeable altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe, and elsewhere. Every Household in the Mountains and Valleys, the Cities, Towns, and Mining Camps of California and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor.

"THE DOCTOR'S WIFE," now in course of publication in London, is universally pronounced to be Miss Braddon's greatest production. It will be completed in sixteen numbers of THE GOLDEN ERA.

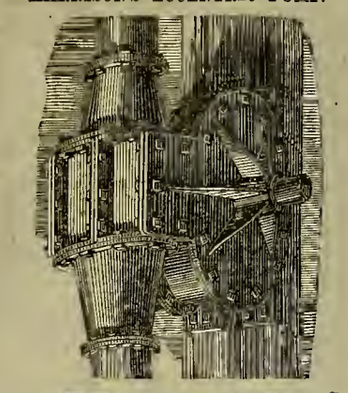
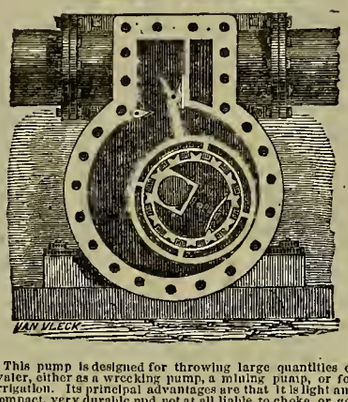
HARRISON'S ECCENTRIC PUMP.





This pump is designed for throwing large quantities of water, either as a wrecking pump, a mining pump, or for irrigation. Its principal advantages are that it is light and compact, very durable and not at all liable to choke or get out of order.

It has no valves and no packing. It is a suction and force pump, and has sucked water up over 27½ feet.

It can run fast or slow, and according to its speed is the quantity of water discharged.

All sizes, capable of throwing from 100 to 5000 gallons per minute. For sale by **C. H. HARRISON,**

THE *Mining and Scientific Press* makes its appearance upon an enlarged sheet. The *Press* is by far the best scientific paper ever published on the Pacific coast. Its contents exhibit both industry and ability. We wish it continued success.—*Washoe Herald.*

SCIENTIFIC AND MINING JOURNAL.—This is as valuable a publication as is produced on the Pacific Coast, and one which interests all parties. It contains much that is instructive and entertaining, and seems to have the right men at the head of its affairs.—*Spirit of the Times.*

Mining and Scientific Press Patent Agency,

SAN FRANCISCO.

Information About Obtaining Patents.

The Patent Law Amendment Act, of March 4th, 1861, and March 3d, 1863, now in force, introduces several important changes in our Patent System. The general practice of the Patent Office, however, in regard to the examination and issue of Letters Patent for new inventions, remains nearly the same as heretofore.

The amendment of 3d March, 1863, provides, in section 3, that every patent shall be dated as of a day not later than six months after the time at which it was passed and allowed, and notice thereof sent to the applicant or his agent, And if the final fee for such patent be not paid within the said six months, the patent shall be withheld, and the invention therein described shall become public property as against the applicant therefor: *Provided*, That in all cases where patents have been allowed previous to the passage of this act, the said six months shall be reckoned from the date of such passage.

The first question, therefore, that presents itself to the inventor, who desires to procure a patent, is: "Can I obtain a patent?" An positive answer to this question is only to be had by presenting a formal application for a patent to the Government, embracing a petition, specification, model, duplicate, drawings, and the payment of the prescribed official fees. Aside from these steps, all the inventor can do is, to submit his plans to persons competent, in his business or obtaining patents, and solicit their opinion and advice. If the parties consulted are honorable men, the inventor may safely confide his ideas to them, and they will inform him whether or not his invention is probably patentable.

Those who have made inventions and desire to consult with us respecting the same, are cordially invited to do so. We shall be happy to see them in person at our office, or to advise them by mail, or through the MINING AND SCIENTIFIC PRESS. In all cases they may expect from us an honest opinion. For these consultations, opinion and advice, we make no charge. A pen-and-ink sketch, and description of the invention should be sent, together with a stamp for return postage. Write plain; do not use pencil or pale ink; be brief.

Remember that all business committed to our care, and all consultations, are kept by us secret, and strictly confidential.

Preliminary Examinations.

In some cases it may be advisable as a measure of prudence to order a preliminary examination. This consists of a special search made at the U. S. Patent Office, Washington, through the medium of our associate in that city, to ascertain whether among all the patents and models there stored, any invention can be found which is similar in character to that of the applicant. On the completion of this special search we send a written report to the party concerned, with suitable advice. Our charge for this service, including the report, is ten dollars. This search, though it involves the expense just named, will usually prove satisfactory. If the same device has been before patented, the time and expense of constructing models, preparing documents, etc., will in most cases be saved; if the invention has been in part patented, the applicant will be able to modify his claims and specifications accordingly. Many other obvious advantages attending the Preliminary Examination; although the strictest search does not always enable the applicant to know positively whether a patent can be had. Applications for patents are often rejected because the Examining officer finds a description of the alleged invention in some foreign publication; or some other person has been previously rejected on an analogous device; or some other inventor for a similar purpose, but partially resembles the applicant's in its construction; or the Government makes an unjust or uncommon decision. Against none of these contingencies does the Preliminary Examination provide; it will, however, generally inform the applicant whether an improvement similar to his and used for the same purpose has ever been patented or not in this country.

Persons desiring the Preliminary examination are requested to remit the fee ($10), and furnish us with a sketch and description of the invention.

Caveats.

A Caveat is a confidential communication made to the Patent Office, and is therefore filed within its secret archives. The privilege secured under a caveat is, that it entitles the caveator to receive notice of a period of one year, of any application for a patent subsequently filed, and which is adjudged to be novel, and is likely to interfere with the invention described in the caveat, and the caveator is then required to complete his application for a patent within three months from the date of said notice. Caveat papers should be very carefully prepared. Our fee for the service varies from $10 to $20. The Government fee under the new law is reduced to ten dollars; and this sum does not apply, as heretofore, as part of the fee on presenting an application for a patent.

Inventors will oftimes find it very important to take advantage of the caveat system—the expense under the law being comparatively small.

To enable us to prepare caveat paper, we only require a sketch and description of the invention; no model being necessary.

Expense of Applying for a Patent, Rejections, etc.

Under the new law, the Government fee, on filing an application for a patent, is fifteen dollars; and if the patent is allowed, twenty dollars additional is required. If rejected, the first fee of fifteen dollars is all that is demanded. English, French, Austrian, Prussian Spanish, and inventors of every nationality, may now obtain patents in the United States upon the same terms as our own citizens. The only discrimination made is against subjects of government that discriminate against the inhabitants of the United States.

To the foregoing official fees must be added the Attorney's fees for preparing the various papers and drawings. Our charge for preparing a case, presenting it to the Government, and attending to all business connected with it, until a decision is given, is from $20 to $40. If the patent is granted no further agency expenses ensues. If the application is rejected we cause a thorough investigation to be made into the reasons presented to the Commissioner for refusing the patent. In making this examination, we have excess to all the drawings, models, books and specifications cited in reference, and we report the result as early as possible to our client. For this service we make no charge. If the rejection proves to be an unjust one—which sometimes happens—it can generally be reversed, and the patent obtained by contesting the case. For this prosecution we charge a fee proportionate to the extra labor involved, payable only on the issue of the patent; but our demand will be reasonable and satisfactory to our clients, and will be arranged beforehand by special agreement.

The system adopted by us works well, gives general satisfaction and presents to all applicants, rich or poor, an equal opportunity of having their patent cases conducted and prosecuted in the best manner, by experienced attorney's, upon the most moderate terms. Inventors who have rejected cases, prepared either by themselves, or for them by other agents, and desire to ascertain their prospects of success by further efforts, are invited to avail themselves of our unequalled facilities in securing favorable results. We have been successful in securing Letters Patent in many cases of such a matter. Our terms for such cases are very moderate.

Models, Remittances, etc.

The law requires that the inventor shall, in all cases, furnish a model, which must not exceed twelve inches in any of its dimentions; it should be neatly made, of hard wood or metal, or both, varnished or painted; the name of the inventor should be engraved or painted on it conspicuously.

When the invention consists of an improvement on some known machine, a full working model of the whole will not be necessary. It should be sufficiently perfect, however, to show, with clearness, the nature and operation of the invention.

As soon as the model is ready, it should be carefully boxed and shipped by express or otherwise, to our address, namely: DEWEY & Co., Mining and Scientific Press, rooms 56 and 57, Government House, corner of Sansome and Washington Streets, San Francisco, Cal. Prepay expenses and send express receipt to us by mail.

Simultaneously with the model, the inventor should send us the first installment of the Government fee, fifteen dollars. The money may be forwarded either by express with the model, or by mail. The safest way to remit is by draft on San Francisco, payable to our order. Always send a letter with the model, and also the remittance stating the name and address of the sender.

A full description should also be sent with the model, embodying all the ideas of the inventor respecting the improvement.

On the receipt of the model and Government fee, the case is duly registered upon our books, and the application proceeded with as fast as possible. When the documents are ready we send them to the inventor by mail, for his examination, signature and affidavit, with a letter of instruction, etc. Our fee for preparing the case is then due and will be called for. The case will then be presented to the Patent Office, and as soon as the patent is ordered to be issued the Government fee, namely, twenty dollars.

Inventors who do business with us will be notified of the state of their application in the Patent Office, when it is possible for us to do so. We do not require the personal attendance of the inventor, unless it is one of great complication the business can be well done by correspondence.

When the invention consists of a new article of manufacture, or a new composition, samples of the separate ingredients, sufficient to make the experiment, and also of the manufactured article itself must be furnished.

The average time required to procure a patent, when the case is conducted at our agency, is three months. We frequently get them through in less time; but in other cases, owing to delay on the part of officials, the period is sometimes extended to four or five months, and even more. We make a special point to forward our cases as rapidly as possible.

Return of Models.

Under the new law, if the applicant's case has been rejected he is entitled to withdraw his model from the Patent Office.

This law applies to all past rejected cases, and if parties wish to obtain their models through us, they can do so at a small expense.

Application for Patents, Designs, Trade-Marks, Labels, etc.

Under the new law patents may be taken out for any new form of any article, also for tools, patterns, castings, machine-frames, stove-plates, borders, fringes, all new designs for printing, weaving or stamping upon silks, calicoes, cotton cloth, prints, paper-hangings, and other articles. Trade-marks, labels, envelopes, boxes and bottles for goods, may also be patented; likewise all works of art, including prints, paintings, busts, statues, bas-relief, or compositions in alto, or basso relievo, new dies, impressions, ornaments to be placed upon any article of manufacture, architecturnl work, etc.

Our facilities for the prompt preparation and securing of patents are of the most thorough character and our charges are very moderate.

Patent Office Fees, and How Payable.

Nearly all the fees payable to the Patent Office are positively required by law to be paid in advance. For the sake of uniformity and convenience, the remaining fees will be required to be paid in the same manner; that is to say, before the labor is performed for which they are to be received in payment.

The following is the tariff of fees established by law:

On every application for a design, for 3 yrs and 6 mos...	$10
On every application for a design, for seven years.....	15
On every application for a design, for fourteen years.....	30
On every caveat.....	10
On every application for a patent.....	15
On issuing each original patent.....	20
On filing a disclaimer.....	10
On every application for a re-issue.....	30
On every additional patent granted on a re-issue.....	30
On every application for an extension.....	50
On the grant of every extension.....	50
On appeal to the Commissioner from Examiners-in-chief	20
On every appeal to the Judges of Circuit Court, D. C....	25

Infringements.

The manufacture, sale, or use of a patented article, without consent of the owner of the patent, is an infringement, and subjects the infringer, by injunc tion from the Court, to an arrest of or prohibition from the employment of his machinery, shop, works, factory and men in production of the article.

In addition to injunction the infringer is liable to be mulcted in treble the amount of damages awarded by the jury. The maker, the workman, the seller, and the purchaser, if a user, are all liable either collectively or individually.

Having access to all the patents, models, public records, drawings and other documents pertaining to the Patent Office, we are prepared to make examinations and give opinions upon all infringement questions, advise as to the scope and ground covered by patents, and direct with vigor any legal proceedings therewith connected. Our charges will be moderate, and proportionate to the labor involved.

Appeals.

In rejected and other cases, the new law provides for an appeal from the Examiner-in-chief to the Commissioner in person, on the payment of a fee of twenty dollars. A further appeal may be taken from the decision of the Commissioner to the U. S. Court, of the District of Columbia. These appeals are heard by any of the Judges before whom the applicant elects to bring the case. No Jury. All the papers, models, etc., are sent by the Commissioner to the Judge, who then reviews the case, and either sustains or reverses the Commissioner's decision.

The party taking the appeal pays an additional fee of twenty-five dollars. The Judge appoints a day of hearing. The applicant can appear in person or by counsel to state his case and file a written argument. Five days are allowed the opponent to put in an answer, and a similar period to the appellant for a closing reply.

Many important cases are brought before the Judges on appeal and the decisions of the Commissioner are not unfrequently reversed.

We have had successful experience in conducting these appeals and our services are rendered on moderate terms.

POSTPONEMENT.—The above sale is postponed until Saturday November 5th, 1864. 11

READY ROOFING

READY TO NAIL DOWN.

READY ROOFING
At less than half the cost of tin roofs.

READY ROOFING
More durable than Tin.

READY ROOFING
Suitable for steep or flat roofs.

READY ROOFING
For all kinds of buildings, in all climates.

READY ROOFING
Easily, cheaply, and quickly put on. Needs no coating over with cement after it is nailed down.

READY ROOFING
Made of a strong woven fabric, thoroughly saturated and covered upon both surfaces with a perfectly water-proof composition, and put up in rolls ready for use—40 inch wide, and 75 feet long.

WE ALSO MANUFACTURE
Liquid Cement,
FOR LEAKY TIN ROOFS.

Much cheaper and more durable than oil paint. Also,

Compound Cement,
For Leaky Shingle Roofs,

Which will often save the cost of a new roof.

Samples of Ready Roofing and Cirenlars sent by mail when desired. Favorable terms made with responsible parties who buy to sell again.

READY ROOFING CO.,
6-tf 73 Maiden Lane, N. Y.

Putnam's Clothes Wringer.

IT IS THE ONLY RELIABLE SELF-ADJUSTING WRINGer. No wood work to swell or split. No thumb-screws to get out of order. Warranted with or without cog-wheels. It took the FIRST PREMIUM at Fifty-Seven State and County Fairs in 1863, and is WITHOUT AN EXCEPTION the best Wringer ever made. Patented in the United States, England, Canada and Australia. Agents wanted in every town, and in all parts of the world. Energetic agents can make from three to ten dollars per day. Sample Wringer sent Express-paid on receipt of price. No. 2, $6.50. No. 1, $7.50. No. F, $8.50. No. A, $9.50. Manufactured and sold, wholesale and retail, by

THE PUTNAM MANUFACTURING CO.,
No 13 Platt Street, New York, Cleveland, Ohio and Bennington, Vt. S. O. NORTHROP, Agent.

What Everybody Knows,

Viz: That Iron well galvanized WILL NOT RUST; That a simple machine is better than a complicated one; That a Wringer should be self-adjusting, durable and efficient; That Thumb-Screws and Fastenings cause delay and trouble to regulate and keep in order; That wood soaked in hot water will swell, shrink and split; That wood bearings for the shaft to run in will wear out; That the Putnam Wringer, with or without cog-wheels, will not tear the clothes; That cog-wheel regulators are not essential; That the Putnam Wringer has ALL the advantages, and not one of the disadvantages above named; That all who have tested it, pronounce it the best Wringer ever made; That it will wring a Thread or a Bed-Quilt without alteration.

We might fill the paper with testimonials, but insert only a few to convince the skeptical, if such there be; and we say to all, TEST Putnam's Wringer. Test it THOROUGHLY with any and all others, and if not entirely satisfactory, return it.

Putnam Manufacturing Co:—

GENTLEMEN. I know from practical experience that iron well galvanized with zinc will not oxydize or rust one particle. The Putnam Wringer is as near perfect as possible, and I can cheerfully recommend it to be the best in use. Respectfully yours,

JNO. W. WHEELER, Cleveland, Ohio.

Many years experience in the galvanizing business enables me to endorse the above statements in all particulars.

New York, Jan., 1864. JNO. C. LEFFERTS.
No. 100 Beekman St.

We have tested Putnam's Clothes Wringer by practical working, and know that it will do. It is cheap; it is simple; it requires no room, whether at work or at rest; a child can operate it. It does its duty thoroughly; if saves time and it saves wear and tear. We earnestly advise all who have much washing to do, with all intelligent persons who have any, to buy this Wringer. It will pay for itself in a year at most. HON. HORACE GREELEY.
6-tf

Bound Copies for Sale.—Bound copies of Volume VIII, complete, of the MINING AND SCIENTIFIC PRESS, from January 1st to July 1st, can be procured on application to the office.

Mining Notices.

Advertised in Previous Issues.

Aspinwall Gold and Silver Mining Company, Amador District, Lander County, N. T.

CAUTION.—The public are hereby cautioned against negotiating for the following described Certificates of Stock of the above named company, as the same were sold for delinquent assessments, on the 13th day of August 1864, and will not be transferred on the books of the company, to wit:

Certificates No. 80, 81, 82 and 83, standing in the name of B. T. Hunt. Certificates No. 71, 72, 73, 74, 75, 76 and 77, standing in the name of W. D. Mathenay.

11 JOSEPH HEALY, Secretary.

Astor Gold and Silver Mining Company, No. 436 Jackson St., City and County of San Francisco, State of California, Ould Hill Mining District, county of Story and Territory of Nevada.

NOTICE.—There are delinquent upon the following described stock, on account of assessment levied on the 10th day of August, 1864, the several amounts set opposite the names of the respective shareholders as follows:

And in accordance with law and an order of the Board of Trustees, made on the 9th day of August, 1864, so many shares of each parcel of said stock as may be necessary, will be sold at the salesroom of Jerome Rice & Co., No. 327 Montgomery street, San Francisco, on the 26th day of September, 1864, at the hour of 11 o'clock, A. M., of said day, to pay said delinquent assessment thereon, together with the costs of advertising and expenses of the sale.

HUGO DRESCHFELD, Secretary,
Office, 14 Naglee's Building, S. W. Corner Merchant and Montgomery St., San Francisco. 11

POSTPONEMENT.—The above sale is hereby postponed until Wednesday, the 5th day of October, 1864, at the same place and hour. By order of the Board of Trustees.

14 HUGO DRESCHFELD, Secretary

Important to Californians.—Many inventors have lately had their claims for Patents seriously (and in some cases fatally) delayed by the unqualification of agents who have not complied with the Government license and revenue laws, as well as other new and imperative regulations These discrepancies, although arising from the inexperience of honest agents, are none the less dangerous to applicants for patents, whose safest course is to trust their business with none but active and experienced solicitors. THE MINING AND SCIENTIFIC PRESS PATENT AGENCY has strictly complied with the requisitions of the Department, and properly filed all necessary papers as Claim Agents.

Good Hope Gold and Silver Mining Company Alpine District, Alpine County.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 12th day of September, 1864, an Assessment of 25 cents per share was levied upon the Capital Stock of said Company, payable on the 3d day of October, 1864, in United States gold coin to the Secretary, at his office, or to H. MORRIS, in Markleeville.

Any stock upon which said Assessment shall remain unpaid on Saturday, the 15th day of October, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on the 29th day of October, 1864, to pay the delinquent Assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

And in accordance with law, and an order of the Board of Trustees, made on the 10th day of August, 1864, so many shares of each parcel of said stock as may be necessary, will be sold, at public auction at the salesroom of Jerome Rice & Co., No. 327 Montgomery street, San Francisco, on Monday the 3d day of October 1864, at the hour of 12 o'clock M., of said day, to pay said delinquent assessments thereon, together with costs of advertising and expenses of the sale.

T. L. BIBBINS, Secretary.

13 Office 302 Montgomery Street, San Francisco.

Table Mountain Copper Mining Company, Stan. Islaus District, Calaveras County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 19th day of September, 1864, an Assessment (No. 6) of one dollar and sixty-five cents per share was levied upon the Capital Stock of said Company, payable immediately, in United States gold coin, to the Secretary, or to J. M. PIKE, Superintendent, Copperopolis.

Any stock upon which said Assessment shall remain unpaid on Saturday, the 22d day of October, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Monday, the 7th day of November, 1864, to pay the delinquent Assessment, together with the costs of Advertising and expenses of the sale.

Ordered that a deduction of Fifteen Cents per share be allowed on all payments made before September 29th, 1864 By order of the Board of Trustees.

N. G. ELMORE, Secretary

Office, No. 621 Clay street.

San Francisco, September 19th, 1864. 13-4t

Tallulah Mining Company, Sierra District, Humboldt County, Nevada Territory.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 5th day of June, 1864, an assessment of $15 per share was levied upon the Capital Stock of said Company, payable immediately then, in United States gold coin, to the Secretary, at the office of the Company, No. 623 Montgomery Street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on Saturday, the 16th day of October, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Tuesday, the 1st day of Nov. 1864, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

CEO. A. HILL, Secretary,

M. C. ELMORE, Secretary.

Office, 621 Clay Street, San Francisco. 12

Worth Considering.—Advertising has proved the medium of success to many of the most prominent business men of the world. Merchants, Inventors, Builders, Patentees, Manufacturers, Foundrymen, Machinists, and, in fact, all who wish to call the particular attention of the Mining, Professional, Mechanical and Industrial members of the community to their business, should not fail to advertise in the MINING AND SCIENTIFIC PRESS. The circulation of the paper is extensive, and has a wide range, reaching the most intelligent readers in every mining settlement of importance on the coast. A large number of copies are also sent East. Our terms are reasonable. "Live and help live" we believe to be a sensible motto.

New This Week.

Cook Gold and Silver Mining Company—Mines located in Esmeralda District.

And in accordance with law and an order of the Board of Trustees, made on the 22d day of August, 1864, so many shares of each parcel of said stock as may be necessary, will be sold at the salesroom of Cobb & Sinton, 406 Montgomery street, San Francisco, on Monday, October 10th, 1864, at one o'clock, P. M. of said day, to pay said delinquent Assessment thereon, together with costs of advertising and expenses of the sale, unless previously paid.

J. A. RAWSON, Secretary.

Office, No. 338 Montgomery street.

September, 30th 1864. 14-2t

Scott Mining and Exploring Company, Humboldt County, Nevada Territory. Office, Northeast Corner of Montgomery and Jackson streets, San Francisco.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 28th day of September, 1864, an assessment of 33⅓ cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary at the office of the company.

Any stock upon which said assessment shall remain unpaid on the 8th day of November 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on the 23d day of November, 1864, to pay the delinquent Assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

V. B. POST, Secretary.

Office, N. E. Corner of Montgomery and Jackson street, Room No. 15. 14-4

United States Mining Company, Virginia District, Nevada Territory.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 30th day of September, 1864, an assessment of one dollar per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary, at his office, or to J. B. COFFEY, Virginia, Nevada Territory

Any stock upon which said Assessment shall remain unpaid on Monday the 31st day of October, 1864, will be advertised on that day as delinquent, and, unless payment shall be made before, will be sold on Wednesday the 16th day of November, 1864, at 12 o'clock M., to pay the delinquent assesment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

J. M. BUFFINGTON, Secretary.

How to make your Remittances.—In most of the mining towns, bankers will furnish checks on San Francisco at par, (or at a very slight advance) to those who wish to pay us for subscriptions, advertising, mining blanks, etc. When it is more convenient, money may be remitted by mail at our risk if the parties sending will register their letters. Money sent by mail is seldom lost if properly enclosed. An excellent method is that of opening the layers of a card, placing the coins between the layers and sealing the edges together.

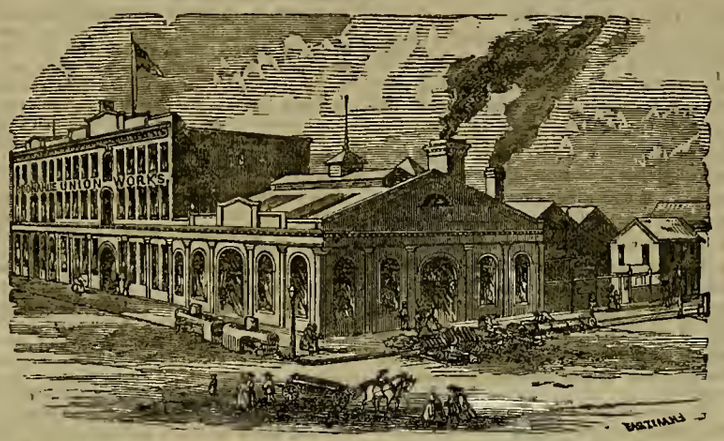
VOLUME IX. Number 15.

THE UNION IRON WORKS.

In the building of the Mechanics' Institute, on California street may be seen the steady bearing of an ocean propeller, the first iron casting ever made on the Pacific coast. The iron was melted by the aid of two blacksmith's bellows, in a rude furnace fitted up in a tent on the beach. This work was done by Messrs. James and Peter Donahue, and was the initiative step towards the establishment of the pioneer Foundry in this city, now known as the "The Union Iron Works." The Messrs. Donahue continued as proprietors until the decease of James, about two years since. The energy and enterprise of these gentlemen, both of whom were skillful mechanics, soon built up a large business, which has grown with the growth of our city and State, until it will now bear a favorable comparison with many of the leading foundry establishments in the Atlantic States. The building which covers the main portions of the works is constructed of brick, three stories high, above the basement, which is also filled with machinery, and has a frontage of 187½ feet on Front street. The rear buildings extend through the block to Fremont street—275 feet. The moulding shop has a frontage on Mission street of 120 feet.



This establishment already contains the heaviest and most extensive machinery and tools on the coast, except those of the Government at Mare Island, to which will soon be added two monster planing machines, which will plane six feet wide, six feet high, and twenty-four feet long, with double heads, and weighing thirty tons. These machines are nearly or quite as large as any in use at the East. They are now on their way thither from New York. They have already a lathe in their shop which weighs twenty-five tons. The moulding shop has been doubled in its capacity this season, and the boiler shop extended through to Fremont street. The boiler department is the most extensive and complete in the State; all the punching, riveting, shearing and rolling machinery being driven by steam. The number of boilers which this firm has made the past year has been about 100—nearly two per week. The number of workmen employed, during the busy season, is from 200 to 250. About 1,500 tons of pig iron, 250 tons of boiler iron, and 400 tons of bar iron and shafting are consumed yearly. The new wrought iron shaft of the Moses Taylor, was made at this foundry, and built up from the original faggots—the only piece of work of the kind ever attempted on the Pacific coast. No other foundry in the city would have attempted such a piece of work.

They are now erecting a new engine of 100 horse power to drive the works. This engine is of superior make and finish, and is furnished with a new and improved cut-off, which works direct from the governor, making a great saving of fuel over the ordinary engines in use. This establishment has furnished the extensive castings and machinery for the San Francisco Gas Works and the mammoth pumping machinery, engine and boiler for the Independent Coal Company, of Mount Diablo. An engine, and boilers, of 135 horse power for the extensive saw mill of Amos Phinny & Co. is now in process of construction at this establishment. They have just finished a 60-horse power engine and boiler for a Mexican mining company, which will be shipped by the next steamer. The firm are agents for, and manufacture, Woodward's celebrated steam pumps. They also manufacture the new Wheeler & Randall pan, Varney's pans, and the latest improved crushing and amalgamating machinery now in use.

The present firm consists of Peter Donahue, H. J. Booth, and C. S. Higgings. The first named gentleman has now been in the foundry business in this State for fifteen years, and brought with him to this country an already ripe experience as a foundry man and machinist at the East. Mr. Booth is well known to the mechanics and mill men throughout the State, for many years, as the former manager of and leading proprietor in the Pioneer foundry at Marysville, which is the largest and most complete, and acknowledged to be the best conducted establishment of the kind in the State outside of San Francisco. He left that establishment some two years since to take an active part as a manager and proprietor in the Union foundry in this city. With Mr. Higgins we are less acquainted, but it is sufficient to say that he is keeping very enterprising company.

The accompanying engraving was made sometime since, and although a familiar representation of Messrs. Donahue & Co's works as they were, is hardly up with the recent improvements. We regret the absence of Mr. Donahue from this city at this time, who alone is able to furnish full facts concerning the early establishment of this the first and leading foundry of the coast.

SALE OF THE "WASHOE."—The ill-fated steamer "Washoe" has been sold to the Oakland Ferry and Railroad Company for "something under $20,000." She will be rebuilt in a proper manner for her new service, after the style of the Philadelphia ferry boats. She will be supplied with entirely new boilers. Her whole lower deck will be left open for teams, without any side entrances, and the passenger cabins will occupy the upper deck. The stern will be lengthened, and the deck ends rounded. The new ferry boat will be ready for service in about two months. Capt. Kidd has been a heavy loser by his steamboat ventures, having lost the Nevada entirely and the Washoe in good part; and it is generally understood that he has abandoned the attempt to establish an opposition to the Navigation Company on the inland waters of California; although from our knowledge of the untiring energy and perseverance of the Captain, we should not be at all surprised to hear, at an early day, that he has laid the keel of a still larger steamer than either of those which he has lost.

THE AWARD OF PREMIUMS.—We have purposely refrained from publishing the reports of premiums awarded, as given in the daily press of the last week, from the fact that those reports are entirely unauthorized and very incorrect. We shall publish them in full as soon as we can obtain a complete and official copy.

THE CALIFORNIA FOUNDRY.

This establishment is situated on Fremont street, near Market. It is of recent origin, having been commenced in April, 1861, by Young & Brodie, but the firm is now known as Brodie & Co. Their business is confined especially to house and ornamental casting, of which class of work they do the heaviest in the State. The iron work of nearly all the recent structures in this city, so creditable to us as a people, issued from this foundry. We might instance the McCreary buildings on Montgomery and Pino streets, and Maguire's splendid new theatre adjoining. The work, however, most creditable to the firm and the State, are the Corinthian pillars and arch forming the portico of Donohoe's new bank building on Montgomery street, recently completed. These four pillars are each fourteen and a-half feet high, and one foot four inches in diameter. The arch surmounting them weighs four tons—the largest of the kind so far made in the State. The entire work is admitted to be chaste and elegant, bearing the strongest testimony to the growth of mechanical art amongst us. This firm employs twenty-five hands. Their largest casting is the arch already spoken of—almost the full capacity of their cupola—which, to meet the growing demands of their business, is to be immediately enlarged. They consume about 104,000 lbs. of iron a month, with 20 tons of coal and a proportionate amount of lumber. This firm is composed of enterprising men, mechanics by education and profession, who owe their respectable position to their industry. A few years, no doubt will show us the California Foundry, if conducted with the same energy and enterprise as heretofore, as one of the leading casting establishments in the State, and a proud evidence in itself of its wondrous mechanical growth.

The accompanying engraving is not a fair illustration of the present works of the California Foundry, the buildings have been so greatly improved and extended during the past three years.

MINERAL PAINT.—In the further portion of buildings connected with the Miners' Foundry, a manufactory of mineral paint has recently been established, which bids fair to assume considerable importance in that line. The mineral from which this paint is made is found in great abundance on Red Island, about ten miles from the Bay. It consists of very fine clay, almost entirely free from grit. It occurs of almost every shade of color from a pure white, running through all the various shades of yellow, red, green, etc. When thoroughly ground, as it is at this establishment, it forms a most beautiful and durable paint, for most purposes far superior to white lead, and at a mere trifling cost compared with lead. It is capable of receiving a high polish, and two or three coats form a very important preventive against fire.

PERSONAL.—We notice among the late arrivals from the East that of Capt. Paul, formerly superintendent of the New Almaden Quicksilver mine. The Captain contemplates an early visit of observation to the Washoe mining region.

ESMERALDA CORRESPONDENCE.

AURORA, Sept. 25, 1864.

EDITORS MINING AND SCIENTIFIC PRESS:—Allow me a word in your valuable paper, descriptive of the mines of Esmeralda District and their management.

LAST CHANCE HILL.

On this hill are situated many of the mines once noised through the streets of your city. The Juniata has rich rock and a pretty good supply of it, but it has been so miserably managed, both at the mine and in the reduction of the ore at the mills, that it has failed to pay. The Empire, Wide West, Ural, and the Real del Monte are all known to be good mines, but injured by bad management. The last named has taken out nearly a million dollars and ought, with proper management, to have divided at least one third of that amount amongst the shareholders, instead of levying the heavy assesments they have; but what else could be expected of managers who have not a solitary member who is a practical miner—not one who knows what a day's work in a mine is—who knows how to drill a hole to advantage (excepting in the pockets of stock holders,) or can tell whether the laborers are doing right or wrong. The consequence is, the foremen, or superintendents are but seldom seen in the mine at all. They spend their time about the town, talking politics, playing cards, or loafing generally. They may perhaps manage to ride up to the claim once a day, or every alternate day, and look over the surface—being too lazy or indifferent to go into the mine—and return, knowing as much of the work, needs and wants of the mine, as they did before going up; and for this they draw the moderate pay of from $10 to $20 per day, whilst the workmen are allowed to do as they please, work or not, and allow every thing to go to rack and ruin.

It is high time that men who invest in mines know how they are managed, and appoint good practical miners for that purpose, who will be at their posts attending to their business at all times, and cast aside those pretending, *kid gloved* humbugs who are afraid to enter a mine least they might dirty their fine clothes, and baadbox dandies who know nothing, and care less, of the interests of the mine and stockholders to whom he is very careful to preseat his hill. Stockholders! until there is a change in these affairs your dividends will be few and far between!

MIDDLE HILL.

This is evidently the rich hill of the district, and the one, too, which will yet bring fame and wealth to Esmeralda. At the crown of this hill there is a grand concentration of all the leads—a fact which is clearly proven by the dips, angles, and bearings of all the leads of the hill, so far as they have been proved. At this point there is evidently an immense body of wealth. Immediately under this point and running directly into it, is the Oxford Beta Tunnel, which is being pushed forward steadily, day and night, under the able management of Capt. T. Lytle, who is well known in Butte county, Cal., for his energy and enterprise, and where he has conducted the largest mining operations of the State. I can safely say the Oxford Beta is one of the very best managed claims in the district. The location is good and I predict a bright future, and a rich reward to the lucky owners.

Above this, some distance, is the Esmeralda, a large and valuable silver mine, under the supervision of W. H. Sewell, a clever lawyer, but no miner. There is but little doing on this and it is well there is not; for under bad management it would run the company into bankruptcy. Near this is the Wianamucca, a good lead also, but very poorly conducted—in fact, with hardly energy enough to do any thing. Below this, to the north, lies the Silver Hill, the Eutaw under Wm. Davis, Iowa, Young Wianamucca, and many others; but all more or less worthless through inefficient management. Next is the Antelope, a good mine and one that has been ably managed, under the guidance of J. Matchell, who has now resigned, owing to trouble with the Young America, and a kid gloved hotch has taken his place. I predict a blacker future for the Antelope. Near this is the Young America—most ruinously managed under the direction of Price & Milsop. The claim is rich beyond all question, but with such barefaced conduct, the company will never see a dividend. Companies have yet got to learn that there is more in the management of a mine to make it pay than in the rock itself. Below this are the Lady Gertrude, Gov. Stanford, and several other tunnels, all of which are being pushed forward with vigor and with fair prospects.

Respectfully Yours,
J. S. MILLER

We are not personally conversant with the facts concerning the above communication, but as the author, in a very commendable style, has endorsed his statements with his own name, we have no hesitancy in allowing him that responsibility.—[EDS. PRESS.

[Written for the Mining and Scientific Press.]

Calaveras County.

The mining district of Mill Valley embraces a scope of country between the Jesus Maria and Murray creeks, and is comparatively speaking little prospected for either placer or other diggings, notwithstanding its close proximity to old mining camps, and the abundant local evidence to be seen of its mineral wealth.—Several years ago a number of quartz veins were located here and some partially opened, prospects obtained which at this time would be called handsome, but for some reason or other, all or nearly so, are entirely abandoned, lying idle. With the exception of the Salamander Gold and Silver Mining Co's claim, which I am opening for that company, I don't know of another now being worked in the district. This is one of those old claims I spoke of as having been partially prospected years ago and abandoned. It was relocated by this company last summer, work commenced on the tunnel which was intended to cut the lead, and which has been prosecuted diligently ever since. It is now within twenty-five feet of the main lode, having been run one hundred and seventy-five feet through hard iron stone. We are now cutting through a distinct and seperate vein, but of what size or quality it is I am unable to say at present. I merely mention this fact in connection with the progress on the tunnel, for the information of those who may own shares in the mine, and are ignorant of its condition.

The lead on the surface prospects well and has been opened in several places, but without reaching a depth sufficient to warrant me in speaking of its probable value. However, the tunnel I am now opening will enable me to do so at an early day, and with your permission, through the columns of your valuable MINING PRESS, I will give to those interested a correct statement of the condition and prospect of the mine. I am aware that the MINING AND SCIENTIFIC PRESS is the proper medium for us miners, to convey whatever information we may have in relation to the mines, or mining operations to the general public, and on the other hand, it is the only paper from which the general reader can successfully seek this kind of information. Miners should bear these facts in mind, as it is the only manner in which we can concentrate into an intelligent focus, all our knowledge on this important interest in which we are engaged. This is well understood here among us miners, and I assure you I cannot keep the PRESS twenty-four hours, so many there are who want to see it. Were it not for this dry season, and consequent hard times, I could increase its circulation four fold, and shall do so this winter. R. W. D.

MILL VALLEY, Sept. 26th 1864.

A TERRIFIC BOILER EXPLOSION occurred about six o'clock, on Wednesday evening last, in the basement of Mr. Ills' salt water bathing establishment near the North Beach railroad terminus. The explosion made a perfect wreck of the building, and several smaller ones adjoining. The engineer was terribly scalded and badly injured otherwise. The cause of the explosion is attributed to the bad condition of the boilers, the flues of which were badly choked up with rust and salt. The proprietor it is said was fully aware of their unsafe condition, and intended to replace them *at an early day!* The alarming frequency of such accidents, calls for the prompt initiation of some steps to put a check upon such a careless employment of steam. Had the accident occurred at an earlier hour, the loss of life must have been large.

TURBINE WHEELS.—A correspondent sends the editor of the Scientific *American* the following question; perhaps some of the manufacturers and inventors of turbine wheels in this State can answer the query: "With a pressure of 100 feet and 25 inches of water (that is, what water would run through a space five inches square, with six inches head on,) [measuring, we presume from the center of the opening,] what would be the power of a turbine wheel five feet in diameter? Also, one using 144 inches of water, 50 feet pressure, and 7½ feet in diameter?

Letter from Los Angeles County.

TAHEECHAYPAH VALLEY, Aug. 24, 1864.

EDITORS MINING PRESS:—I arrived here three days since from El Paso district, by invitation from P. D. Green, Esq., the only Union man located in this part of the State, so far as I can learn. Mr. G. has been engaged most of the time for eight years past in placer mining in this valley, with moderate success, and is now effecting arrangements for enlarging his operations, during the approaching rainy season, which will without doubt, very much increase his receipts. I shall take an early opportunity to look over the district and report to you hereafter. This change affords me an excellent opportunity to recuperate, after a stay of seventeen months in the hot, dusty, barren cañons of El Paso. The climate here is delightful beyond anything I have met elsewhere in the State. The thermometer ranges, in the hottest weather from 70° to 85°, in the shade; rains have fallen often during the summer, and we have the bracing ocean breeze most of the time, though much milder than around San Francisco Bay, coming as it does over the plains lying west of the Sierra Nevada, in a pass of which this valley is located. Every variety of fruit and vegetables are easily raised here, but the inhabitants exhibit very little ambition in that direction.

The horrible news reached me, last evening, of the murder of Mr. Geo. W. Yarbrough, of El Paso, by Indians, while passing from Mesquit Springs to Laurel Hill, on the morning of Thursday, Aug. 18th, with a pack mule loaded with supplies for his camp. Mr. Yarbrough was Superintendent of the operations of the Yarbrough Mining Company, in El Paso, and was highly esteemed by all who knew him, and his loss is felt as a terrible calamity upon our little community. The company continues the work in their drift, with great encouragement, from a change in the rock, which denotes a near approach to the lead. C. W. T.

Communicated.

EDITORS PRESS.—I regret to learn that the writer of "The Mathematics of Mining" persists in demanding certain conditions of compliance on my part, ere he will expose his budget of facts. He does not appear to be animated by the spirit of the girl, who said, that of all names labeling humanity, she thought her own name of Joaes the prettiest, and of all names she most despised, there was none worse than that of Sniggles; but that she so much pitied a nice young man possessing such a name, that she really felt like helping him to sustain his mortification through life. As those threatening "facts" are unknown quantities, which I should not object to seeing algebraically represented by the symbol x, and the name of "Pundit" (pardon me for quoting the remark of an appreciative critic,) "is a mathematical immensity which must be *major* to all other things so long as human existence depends upon the addition of *minors*," therefore those momentous facts must continue to remain in secret trust, and the ancient name of "Pundit" like a laurel leaf still retain its honorable connection with a branch of the human family first watered by the flood of Noah though not out in the wet.

Pundit has wasted no powder in his aim, whatever he may have done in regard to the game, for that "or" filled no necessary crevice of his investigation; he is content to leave the analysis of typographical errors with verbal assayers and microscopic soothsayers. In his correction, Mr. Easton places in plain view one of the objects of my strictures, the application of the term "primitive" to the obviously sedimentary rocks of California. Another column of the PRESS shows that my position is sustained by the State Geologist, and that our auriferous sedimentary rocks are of a comparatively recent geological birth.

PUNDIT.

THE CRANBERRY CROP, on Cape Cod is a failure, the present year. The Barastable *Patriot*, in noticing the fact, says the failure will be less regretted, by consumers, in consequence of the present high prices of sugar. The cause of the failure is said to be the appearance of the "vine worm." From present indications there will not be more than half the usual crop in that section of the State. The worm has done so much damage that in the single town of Harwich the cranberry crop will be two thousand barrels less than that of last year.

YIELD OF LAKE SUPERIOR COPPER ORE.

The Lake superior Copper region is divided into three great copper districts, known respectively as the Keewena, Portage Lake and Ontonagon. Portage Lake being the central division may be taken as a fair representation of the entire region, and the operations of the six leading mines there will serve as a good illustration of the whole. A statement of their operations was recently made as follows:

Mines.	Aggregate Cost of Stock.	Cost per share	Total value of Mine.	Dividends
Quincy	$160,000 00	$8 00	$1,900,000 00	$380,000 00
Pewabic	120,000 00	6 00	1,200,000 00	240,000 00
Franklin	80,000 00	4 00	1,000,000 00	60,000 00
Isle Royal	250,000 00	12 00	600,000 00	
Huron	340,000 00	12 50	800,000 00	
Grand Portage	50,000 00	2 50	800,000 00	
	1,000,000 00		$6,400,000 00	$640,000 00

The mines of Portage Lake yield something like fifty per cent of the whole copper productions of Lake Superior. The principal mine in the district as will be seen from the above table is the "Quincy." The following particulars with regard to the yield of this mine will be read with much interest by California miners. In 1863 the percentage of the yield of all the ore from this mine was only *two and three quarters per cent.* The profits of the year's business was in round numbers $380,000. The company paid two dividends of six dollars per share each, and carried forward six dollars more per share, all out of the profits of 1863, and from 2¾ per cent rock mined in a locality where the cost of living is fully as great as it is in California. The low percentage of the ore taken from this mine, and the large profits derived, must serve as a source of much encouragement to our California copper miners, who are throwing away thousands of tons of ore every month which will yield double the percentage named as the aggregate yield of this mine. Quincy shares sell in Boston at $102. We have collected the above facts from two articles on the Lake Superior mines; one of which we found in the Philadelphia *Mining Journal*, and the other in the New York *Journal of Commerce*, each very good authority. In addition to the above we add the following from the latter paper:

The stimulus imparted by the high price of metals, and we might add the rage of speculation, has thrown large amounts of capital into mining operations, developing with a rapidity before unknown, the rich products of the region bordering on the northern lakes. Marquette, which is situated about half way between Sault Ste. Marie, at the entrance of Lake Superior, and Ontonagon, at the farthest extremity of the mineral range, is the great centre of the iron interests from which the shipments are made. The business done there this season will exceed that of any former year. In one day last month there arrived at that port (where are extensive wharves and apparatus for receiving ore by rail direct from the mines, some fourteen miles distant) seven steamers, nine propellors and twenty-eight sail vessels, all bringing supplies from Detroit, Cleveland and Buffalo, and returning with ore for the smelting furnaces. In a single fortnight, in July, the shipments of ore exceeded 20,000 tons, and from the opening of navigation to the close of that month the shipments amounted to 90,000 tons, exclusive of a large quantity of ore already converted into pigs. For the whole season the value of exports from Marquette will be not far from $2,000,000, according to present estimates.

To travelers, thousands of whom visit the lakes every year, attracted in part by the picturesque scenery, the copper mines are more interesting than the deposits of iron. The latter present little more than an ordinary embankment, from which masses of ore are thrown down to the common level for transportation, while copper is taken from the earth at a great depth, and, when freshly broken, captivates the eye by its brilliant colors of gold and green, intermingled with sparkling quartz; and the crystalizations are often so fantastic as to attempt profuse expenditures on the part of those searching for souvenirs of that far-off region, isolated from the rest of the world six months of the year.

HOW TO PAY THE WAR DEBT.—We are well aware of the locomotive proclivities of the citizens of the United States, but we are not quite ready to accept the idea of an Eastern writer who says that a tax of twenty-five cents on each person who travels fifty miles and over on a railroad in the United States, would, in a few years, produce sufficient revenue to pay off the war debt.

The Formation of Chloride Ores.

Professor Silliman, during his visit at Austin, Reese River, favored the citizens of that place with a very interesting lecture on the "Mineral Resources of Lander County." Among other interesting things touched upon was "how came the ores near the surface to be chlorides, while those at a greater depth were of sulphurets?" His theory of the formation of the chloride ores of the Great Basin, and the former condition of that region, appears to be quite satisfactory, and will doubtless be generally accepted as correct. We copy from the Reese River *Reveille*:

The learned Professor, in explaining this, presented before us the Great Basin of Nevada as one vast sea of intensely salt water, heated and boiled by volcanic fires, the evidence of which can be seen in every part of the Territory. The action of this hot salt water had a similar effect upon the silver bearing veins to the roasting of the ores in contact with salt, as is now done at the reduction works. Salt, as is well known, is the chloride of sodium, formed of chlorine and soda, where for a long time in contact with silver, or more particularly, with a sulphuret of silver, which is silver chemically combined with sulphur, the chlorine having a great affinity of silver, joins it, displacing the sulphur, and the new combination is chloride of silver, the ore so plentiful throughout this section. The subterranean fires that heated the waters have almost entirely disappeared and with them the boiling ocean. This hot water penetrated the earth with its salt to the depth of twenty, forty or eighty feet, as the rock would permit, and whenever coming in contact with a sulphuret ore changed it into a chloride, as we find it. In many lodes the sulphuret ore is not all transformed. In some the veinstone is very hard and appears to have protected the sulphur from contact with the liquid chloride of sodium, in others throughout the seams of rock, the change has taken place, while in the central part the black sulphuret in a very pure state still exists.—These sulphurets near the surface, or where associated with chloride ore, are considerably different from those taken at a greater depth, and appear to have undergone a chemical change. The question then is, how was this chemical change produced, if not by contact with a hot solution of salt? It is by these means alone that the change can be made artificially. The presence of salt is required, and salt is abundant in the country. Heat also is required, and there is still evidence of the existence of volcanic fires. These have not yet all passed away. Throughout the Territory, perhaps more than in any other part of the world, are hot springs, still boiling, bubbling and steaming away. Some have become cold, others are but warm, as if the internal fires that heated them had receded beyond their deep subterranean channels. The same cause that has removed the internal heat, has probably furnished the drain of the surface waters, and leaves the country in the singular condition of a basin, without an outlet to the sea.

Boot and Shoe Manufactory.—It is stated that several persons of energy and capital have it in contemplation to establish in this city, a manufactory, on a large scale, for custom made boots and shoes, to be fitted up with all the recent improvements in economical machinery, etc. It is estimated that the annual expenditure in this state for these articles of indispensible wear is not less than five millions of dollars. The late Mechanics' Fair exhibition, has shown that we can produce both a fair quality of goods of this description, and also the raw material out of which they are made.

Expeditious Post Office Work.—The mail by the last arrival of the Golden Age, was the largest ever received on this coast, and it was all sorted and distributed within twenty-four hours after its arrival, notwithstanding that it consisted of 70,000 letters and 180 large sacks of newspapers. This is said to be a feat unequaled by any Post Office in the Union.

Carson River is unprecedently low at the present time. The *Enterprise* says it looks like rather an insignificant stream to be dignified with the appellation of "river," being a mere rivulet wandering among a chaos of sand bars.

Rich Quartz.—The Monitor Company, at Sugar Pine, Tuolumne county, sent a ton of quartz from their vein to San Francisco, to be properly tested. The result was that by working process the rock yielded five hundred and sixty dollars per ton. The lot was taken directly from the lode, without selection.

"Give me Three Grains of Corn, Mother."

BY MRS. EDMOND.

[The above words were the last request of an Irish lad, dying from starvation. His mother found three grains in a corner of his ragged jacket and gave them to him. She had no more; the whole family were perishing from famine.]

Give me three grains of corn, mother,
Only three grains of corn,
It will keep the little life I have,
Till the coming of the morn.
I am dying of hunger and cold, mother,
Dying of hunger and cold,
And half the agony of such a death,
My lips have never told.

It has gnawed like a wolf at my heart, mother,
A wolf that is fierce for blood,
All the live-long day, and the night beside,
Gnawing for lack of food.
I dreamed of bread in my sleep, mother,
And the sight was heaven to see;
I woke with an eager famishing lip,
But you had no bread for me.

How could I look to you, mother,
How could I look to you,
For bread to give your starving boy,
When you were starving too?
For I read the famine in your cheek
And in your eye so wild,
And felt it in your bony hand
As you laid it on your child.

The Queen has lands and gold, mother,
The Queen has lands and gold;
While you are forced to your empty breast
A skeleton child to hold;
A babe that is dying for want, mother,
As I am dying now.
With a ghastly look in its sunken eye,
And famine upon its brow.

What has poor Ireland done, mother,
What has poor Ireland done,
That the world looks on and sees us starve,
Perishing one by one.
Do the men of England care not, mother,
The great men and the high,
For the suffering sons of Erin's Isle,
Whether they live or die?

There is many a brave heart, mother,
Dying of want and cold,
While only across the channel, mother,
Are many that roll in gold.
There are rich and proud men there, mother,
With wondrous wealth to view,
And the bread they fling to their dogs to-night
Would give me life and you!

Come nearer to my side, mother,
Come nearer to my side,
And hold me fondly as you held
My father when he died.
Quick, for I cannot see you, mother,
My breath is almost gone,
Mother! dear mother! ere I die,
Give me three grains of corn!

Burglars Shot.—Two notorious burglars were shot by officers Green and Coulter, on Monday night last. They were met under suspicious circumstances, loaded with goods, ordered to halt, which they declined to do, but threw down their goods and ran. One was shot through the thigh, and the bone so badly injured that amputation was found necessary; the other was shot in the arm so badly that amputation in his case was also found necessary; a third was arrested and taken to the calaboose. The three are well known as desperate fellows.

The Aurora Homicide.—The coroner's jury, in the investigation of the killing of C. E. H. Wheaton, in Aurora, on the 29th ult., found that he came to his death at the hands of W. B. Lake, and that the act of said Lake was justifiable homicide. Mr. Lake is well known in this city and elsewhere, a sa gentlemen of unimpeachable character, slow to take offense, and never known to provoke a quarrel. There can be little doubt but that the verdict above given was fully justified by the facts in the case.

A Noble Act.—H. D. Cogewell, of this city has tendered by letter, to the Sanitary Commission, through its Secretary, the Rev. O. C. Wheeler, the rent of a certain building, now renting for $75 per month, the entire proceeds of which are to go for that object during the continuance of the war. Such a noble act is especially worthy of honorable mention.

Hanscom's Crusher.—We understand that Mr. Hauscom is now making one of his crushers, of small size, for Holt & Co., of Humboldt. The work performed by this machine attracted much attention at the recent Fair, and will doubtless secure many orders for them.

Coal Mining in China.

The only coal mines in China, of which we have any account, are located about five miles north of Kuh-shan-kau, and not far from the city of Pekin. The editor of the China *Mail*, recently visited these mines and makes the following brief report, which will be interesting, as showing the manner in which the Chinese carry on mining operations at home:

There are but fifteen shafts open, each of their entrances being enlarged into a room, where the colliers sleep and eat at times, though more comfortable dwellings have been built for overseers and contractors. We engaged a miner to show us down the largest shaft, which measured on the average only 4½ feet high by 5 feet wide; it is cased with willow sticks in a secure manner, and the roof is particularly well guarded. The bottom is lined with the same to form a ladder, up and down which the miners travel in their daily labor. This shaft is about 150 feet deep, and the ladder down to the diggings is, perhaps, 600 feet long. The coal is secured on small wooden sledges, and drawn, as the miner slowly crawls up along the narrow and slippery steps, by a strap passing over his forehead, each load weighing 80 catties. One workman brings up six loads as his day's work. The sides of this shaft showed the width of the veins of coal, but the top and bottom were not dug out. The whole, was very dry, owing probably to its elevation up the hill; but some shafts had been abandoned from wet and bad air, and their mouths closed. The laborers are hired out by contractors, who sell the coal to the dealers coming from Pekin and elsewhere; it is all carried away on the backs of camels or mules, and it is a painful sight to see the unwieldy camels coming down the rocky, uneven road, bringing their loads of coal. It is delivered in Pekin at about three piculs for a dollar, and a large part of the price is for carriage. The coal is hard, but each examination as the time afforded disclosed not a vestige of a stump or leaf to compare with the fossils of other coal regions; more careful researches will doubtless bring to light some indications of this kind, enabling scientific men to compare the numerous deposits of soft and hard coal in this part of China with the European coal measures.

The Gold Mines of Nevada County.

Nevada is the leading mining county of California. It has the largest mining population, the largest gold yield, the most thorough system of ditches, the most profitable quartz and hydraulic mines; and within its borders many of the most important mining inventions were made or first applied in this State. The total annual gold yield of the county is probably $2,500,000; and the yield nine years ago was estimated at $4,000,000. Perhaps one-third of the gold of the county comes from quartz, in which there is a steady increase, while in placer mining there is a steady decline. The county is mainly supplied with water from four large ditches, which have cost altogether about $1,500,000. At Grass Valley, which is the leading district of the State, the principal claims are those known as the Allison, the Watt, the Fricot, the Lafayette and Helvetia, the Fellows, and the Rocky Bar. The Allison mine now yields from $10,000 to $12,000 weekly, and the rock yields from $70 to $80 per ton. The mine is 300 feet deep, and a streak of the lode from two to four feet wide is worked. The Fellows claim is a late discovery, and was extremely rich at the surface, two men having pounded out $100,000, with hand mortars, from the quartz within six weeks. The Rocky Bar mine, now owned wholly or partly by Messrs. Hentsch & Berton, was opened ten or twelve years ago. It was rich near the surface, but then became barren. It was owned by a company, and six or seven years ago was superintended by a young Irishman named Brennan, who, feeling very sanguine about the claim, sank a deep shaft a hundred and odd feet, investing all his own money and all he could borrow, and when he struck the lode he found nothing. The disappointment was so great that he poisoned his wife, his children and himself. It is said that a late examination has shown that the lode is rich at the very spot where Brennan struck it, but the lode, like many others near Grass Valley, is in two streaks, separated by barren rocks, and Brennan stopped after getting through the first streak.—*S. F. Alta.*

A cure for whooping cough is announced in France, of rather a singular character. It is inhaling for a few moments the vapor given off by the lime which has been used in the purification of coal gas.

Rev. S. D. Simonds has been suspended for one year by the Methodist Episcopal Conference. His offence is purely doctrinal, and has no reference to his moral character.

Important Decision.—Upon the 17th day of April, 1863, Charlotte L. Brown, a negro woman, went into one of the cars of the Omnibus Railroad Company, of this city, and was expelled therefrom by the conductor for the reason that she was a negro, and her presence was offensive to the white people in the car. She subsequently brought suit against the Company for five thousand dollars damages. The complaint charged substantially as stated above. The Company, through its attorney, answered the complaint by stating that Charlotte L. Brown was a negro, and that her presence was not agreeable to the white patrons of the Company, whose interests would be greatly damaged if negroes were allowed to ride on the cars.

The attorney for the plaintiff, in reply to the answer of the Company, moved to strike out all that portion of the answer which related to the plaintiff being a negro.

The motion came before Judge Pratt, of the Twelfth District Court, some days ago, and was argued by both sides thoroughly. Judge Pratt decided on Monday last, in relation to the motion, and granted it.

This virtually decides that negroes have the same right to ride in the street railroad cars that white people have, whether it injures the interests of the Railroad Company or not.

A Powerful Disinfectant.—The fumes of burning coffee have long been known to act as a powerful disinfectant. Experiments have recently been made at Paris to prove this. A quantity of meat was hung up in a closed room until decomposed, and then a chafing-dish was introduced, and five hundred grammes of coffee thrown on the fire. In a few minutes the room was completely disinfected. In another room sulphureted hydrogen and ammonia were developed, and ninety grammes of coffee destroyed the smell in about half a minute. It is also stated that coffee destroys the smell of musk, castroeum and asafœtida.

What is a "Bohemian?"—The great majority of those to whom the phrase conveys any meaning whatever, understand a Bohemian to be a reckless, ruined person, possessed of some flashes of genius or intellect, which give little light to the world, and only lead their owner astray; a man too lazy to work, and not too proud to live on fortune and chance; one degree above a beggar; utterly improvident and good for nothing; dissipated, and perhaps profligate; rude in manners, and not overclean in person; but all the while immensely self-conceited, taking a pride in his recklessness, his idleness, his dissipation and his dirt.

The Harvest in Europe.—The reports from the principal agricultural districts in England give a favorable account of the harvest, which is now being rapidly gathered in various parts of the country. The weather lately has been highly propitious—occasional falls of rain followed by abundance of sunshine and warmth. The crops in Ireland are also well spoken of, especially the potatoe crop, which is now said to have passed its dangerous stage. The continental crops are also, for the most part, encouraging.

Extremes in California.—The Sacramento *Bee* illustrates the extremes which are so often presented in California life, by noting the circumstance that a little over two years ago charity was appealed to aid some inhabitants of the Sacramento Valley who were near perishing from the effects of a terrible flood. Now charity is called upon to aid the inhabitants of Santa Barbara, who are perishing from the effects of a terrible drouth.

The Beet Cigars.—It is not generally known that the best Havana cigars are made from tobacco dipped in a solution of opium. Natural leaf tobacco never has that peculiar effect, as will be noticed upon smoking the best clean leaf in a pipe. It is the opium in a first rate cigar, and not the tobacco, which smokers get enslaved with and cannot get along without. In some of the Havana establishments, twenty thousand dollars' worth of opium a year is issued.

The Washington *Chronicle* announces that "the finishing touches to the exterior of the magnificent dome of our capitol were given yesterday. It is now completed, and stands a proud monument to American skill and mechanism." The height of the dome from the ground, on the east front, is 287 feet, and about 370 feet from Pennsylvania avenue.

Terrapins.—These animals have been found in considerable quantities in the bay of San Diego. They are supposed to be the progeny of a lot taken there some years ago from Mexico and turned loose.

The Acorn Crop.—The branches of the old oak trees in Feather river valley, says the Oroville *Union*, are bending with acorns. It is remarked by the oldest settlers as the most abundant yield ever known. Hogs and Diggers are growing fat and sleek.

City Stock Reports---San Francisco Stock and Exchange Board.

From the "Weekly Stock Circular" of the Associated Brokers.

SAN FRANCISCO, SATURDAY MORNING, OCT. 8th, 1864.

Leading stocks, with scarce an exception, have been well sustained since Saturday last, and a number of them have continued to advance. Their net yield last month proves to be larger than was anticipated, and more confidence is now felt in future productiveness. The fears entertained sometime since respecting most of the Comstock claims, have given place to different views, and it is believed by many that recent developments have not only set at rest these apprehensions, but have disclosed a certain degree of wealth not calculated upon at any former period. The effect of this has been to inspire renewed faith, and to enhance prices. A number of dealers who are well informed, maintain that the present condition of some of these mines never was so promising, and that current quotations at the Board do not fairly represent their real value. They contend that the apparent deterioration of one or two mines should not unfavorably influence others known to possess intrinsic merit and giving every reasonable appearance of future permanency. But the losses sustained a few months ago, by nearly all classes should not be lost sight of or forgotten, however causeless may have been the panic which immediately followed and which still exerts a demoralizing influence over the whole market. A restoration of confidence must and will ensue if the better class of mines are enabled to pay regular dividends to stockholders, and an honest and economical administration of their affairs is adhered to.

Speculative shares are nearly all lower this week and appear to be in less favor, owing doubtless to the sudden and material rise of last week.

Legal Tender Notes have been quite active and large sales were made within a range of 51½, seller 60, and 54¾ regular way. $83,000 were sold at 53½c.

California Steam Navigation advanced from 60 ₱ cent. ($600 ₱ share) to 75 ₱ cent., at which latter rate 15 shares were sold. At the close 67½ was bid. An accumulating surplus fund and the withdrawal of opposition from the Sacramento river, have occasioned the recent advance.

State Telegraph was sold at $37 ₱ share. Pacific Insurance Company is enquired for at $109; a quarterly dividend of $6 ₱ share was paid on the 6th inst. California State Bonds are in demand at 70, and San Francisco 6s of '58 at about 61.

Savage declined from $1,550 to $1,500, rose to $1,600, then sold at $1,525, ex-dividend of $75 per foot, and closed last evening at $1,625 asked. The net revenue of this mine for the month of September, exceeded $100,000 in addition to the payment of $60,000 to stockholders. Some $30,000 were disbursed for extraordinary expenses. New deposits of ore have been met with in drifting east and west from the old works in the third level and a drift from the fourth level now discloses the wealth of the North Potosi chimney. About 160 tons of good ore are now daily hoisted to the surface and the yield of Bullion for the current month promises to exceed that of any former period.

Gould & Curry fell from $1,250 to $1,100 on Monday, then steadily rose from $1,175, ex-dividend, to $1,400 and closes at $1,360 bid. So far as we can learn authoritatively, no change in the superintendency of this mine is contemplated, nor has there been any cessation of operations effecting its regular yield of ore. Some 100 tons daily have been sent to the Company's new mill which is running up to its full capacity. It is said that a large body of good ore has been found at a point least expected.

Chollar steadily advanced from $690 to $750, within which range 44 feet were sold, and yesterday closed at $825 bid, $850 asked. The receipts of Bullion since the 1st inst., amount to about $35,000. The chimney of ore in the south mine has been traced 100 feet on the eastern face of the vein, and the lode has now attained a width of 30 feet.

Potosi is in more favor. Ten feet were sold at $720@$745. A decision from the Referee is looked for next week in the suit of this Company with the Bajazet.

Yellow Jacket rose from $615 to $650, slightly receded to $640, and is now held at $650; eleven feet were sold. Hale and Norcross rose to $420, and then declined to $350,

Ophir has been largely dealt in, and 81 feet changed hands, opening at $400, declining to $370, advancing to $415, dropping to $350, and closing at $345. The deposit of ore found recently below the seventh gallery in the old works may, it is thought, lead to more flattering developments.

Belcher is held at $800. The new machinery of this Company will, it is believed, effectually drain the mine so that active operations can be resumed. Best and Belcher is in request at $120, and Uncle Sam at $200. Overman was sold at $160.

Imperial rose to $154, 134 shares changing hands, and is now held at about $145, ex-dividend of $7.50 ₱ share paid on the 5th inst. After the payment of this dividend a considerable surplus was left in the treasury of the company.

Sheba fell from $80 to $70, rose to $75, and closed at about $72. Bullion has been in some favor and 206 shares were sold, advancing from $65 to $80, steadily receding to $68, and selling yesterday at $65. This claim is said to be one of some promise.

Burning Moscow has continued to be actively dealt in, and 1,847 shares were sold at fluctuating rates, declining from $58 to $40, advancing to $54, again receding to $40, and again rallying to $54, then falling to $41, rising to $47, and selling last evening at about $45. We learn of no good cause for the late rise in this stock.

Wide West rose to $34, receded to $27, and closes at $27. The official report of officers of the company is said to be favorable; 287 shares were sold.

Nevada, J. G., is in less favor, and 134 shares changed hands steadily dropping from $50 to $35. Blue Ledge was sold to the extent of 615 shares within the range of $3 and $1¾ ₱ share.

Lady Bryan is still a favorite speculative stock, and 848 shares were dealt in, declining from $8 to $6½, and then rallying to $7½@8½. Pride of the West fell from $8 to $3½, and then advanced to $5.

Daney fell from $27 to $14, and rose to $25; Buckeye fell from $14, buyer 30, to $9, and then advanced to $14; Golden Age and Empire sold at $17@18, and Baltic at $28@$26.

Antelope advanced from $15 to $21, and fell to $19 closing at $19; 77 feet changing hands. Real del Monte declined to $22, and rose to $27. Utah was sold at $6; Burnside at $2½; Josephine, Coso, at 4¼; Michigan at from $12 to $14, and Greene (Gold Hill) at $5¾.

Josephine Copper is in request and firmly held at $17, and Napoleon at $80. The aggregate sales of stocks since Saturday last amount to $349,273.75.

Commissions on Mining Shares.

Sale at 1 dollar up to 10 dollars	$0 25 per foot
Sale at 10 dollars up to 25 dollars	50 per foot
Sale at 25 dollars up to 50 dollars	1 00 per foot
Sale at 50 dollars up to 100 dollars	1 50 per foot
Sale at 100 dollars up to 200 dollars	2 50 per foot
Sale at 200 dollars up to 400 dollars	5 00 per foot
Sale at 400 dollars up to 600 dollars	6 00 per foot
Sale at 600 dollars up to 800 dollars	7 50 per foot

From $800 to $3,000 per foot, one per cent, on the amount of purchase or sale.

Anything above $3,000 per foot, three-quarters of one per cent. on the amount of purchase or sale.

J. B. E. CAVALLIER, President.

A 160-TON CASTING.

Another immense casting has recently been turned out by Messrs Stauley & Co., of the Midland Works, Sheffield, England, viz., a 160-ton anvil block for a steam hammer. The mould was framed in a large pit, in the floor of the casting shop. The mould was twelve feet square at the base, eleven feet six inches deep, and 170 tons of iron were melted to make sure of the cast. Five furnaces were employed, from each of which, when all was ready, a stream of molten iron, was made to run slowly to the edge of the pit, into which they continued to fall, amid showers of strong sparks until the chasm was filled. At this time a rod was thrust into the mass to test its perfect liquidity, which having been satisfactorily proven, the pit was carefully closed to allow for the process of cooling, which it was supposed would require *about seven weeks!*

The "hed" upon which this "distinguished stranger" will repose, when introduced to its expectant "home" in the gun factory of Messrs Firth, is of a truly substantial character, and has been prepared as follows: First, a course of great piles were driven fifteen feet into hard ground. Upon these were placed a thick block of oak, solidly braced and bolted together, upon the top of which the monster casting will be so placed that only about one half of its bulk will appear above ground. The object of such an enormous casting, so strongly planted, is to secure an anvil which no reasonable force can shake. It will be subject to the blows of a 25-ton steam hammer, which will be employed in forging 300 and 600-pound cannon, which are being made under the direction of Mr. Whitworth, for the armament of British forts and fleets. It is said that the guns turned out at this establishment have stood the unprecedented test of 3,000 rounds, without showing any symptoms of failure.

READING ALOUD IN THE FAMILY.—Books and periodicals should be angels to every household.

They are urns to bring us the golden fruits of thought and experience from other minds and other lands. As the fruits of the trees of the earth's soil are most enjoyed around the family board, so should those that mature upon mental and moral boughs be gathered around by the entire household. No home exercise could be more appropriate and pleasing than for one member to read aloud for the benefit of all. An author's ideas are energized by the confidence and love of the tender family affections, and every heart is open to the truth like the unfolded rose to receive the gathering dews. The ties of love between parents and children, brothers and sisters, are thus cemented more closely, and varied charms and pleasures are counted upon through this medium to make a home a perfect paradise. If parents would introduce this exercise in their families, they would soon see the levity and giddiness that make up the conversation of too many circles, giving way to refinement and chaste dignity. Read to your children, and encourage them to read to you, instead of reading your papers and books in silence, and in silence laying them away.—*Western Recorder.*

THE TIN MINES OF CORNWALL.—The adventurers in the tin mines of Cornwall appear to be thoroughly aroused to the necessity of a new plan or system for the sale of tin ore, and there seems little reason for doubt that unless a better price be obtained, Cornish tin mining will to a great extent be abandoned. Tin cannot be raised at a very large majority of the mines under £70 to £75 per ton; the present price is about £60. There are not more than half a dozen mines in that county which leave any profit to the adventurers. The system of underselling has had a ruinous effect, and it is thought that the only way to stop such proceedings is to have public sales, as in the case of copper. It is calculated that 15,000 tons of tin ore are raised annually in Cornwall, representing a revenue of £1,000,000 sterling.—*London Times.*

AN IMMENSE WINDOW.—A stained glass window, which, when finished, will be the largest in the world, is being executed at Cologne for the cathedral, at the sole expense of the Crown Prince of Prussia. Over the west entrance into the nave between the two towers, there will be a window 70 feet in height, and this window will receive in gigantic proportion a representation of the Last Judgment. The design is from the cartoons of Peter von Cornelius, and was originally intended for the Campo Santo, at Berlin, where, however, it was never executed.

THE HORSE SHOERS' STRIKE IN NEW YORK.

Quite a serious trouble has originated in New York between the horse shoers and the city railroad companies relative to the use of the machine made shoe. The strike became so general and so persistent that the companies could not get their horses shod at all, and were obliged to haul off a portion of their cars. The companies, however, made more in that operation than the strikers, as it reduced their expenses, while by closer crowding, they were able to carry nearly as many passengers as before. While the traveling public has been seriously incommoded by the strike, the companies have saved thousands of dollars. Efforts were made to remedy the evil by importing blacksmiths, but the "Union" men managed to buy them off, paying $10 per week to married men, and $5 to single. At this stage of the game a new phase was developed. It appears that the objection to the use of machine made shoes was not so serious a matter as the use by the machine of American iron in the manufacture, while the forged shoes were made of imported stock. It has been discovered that several large iron importing houses are at the bottom of the movement and have agreed to furnish the "Union" money enough to keep the "strike" in operation. The "Union" has accordingly again published a notice to the members to continue steadfast, and that they will be sustained. The contest has thus become one between the iron dealers and the companies rather than the mechanics, and has therefore assumed more formidable dimensions and additional interest. One of the journeymen blacksmiths, who wouldn't "strike" was murdered by a mob of the Horseshoers' Union, one of whom buried a hammer in his skull. The murderer has been arrested. Numerous other acts of violence are noted.

RAILROAD GRADES OVER THE MOUNTAINS.—Some writer in a recent communication to a Virginia paper states that a company of engineers has recently surveyed a railroad route over the mountains into Lake Valley, with a grade of only sixty-two feet per mile. The impossibility of crossing the mountains with so low a maximum grade, is shown by a correspondent of the American *Flag* as follows:—

The summit of Lake Valley is at least 7,000 ft. above the level of Sacramento. The distance from Sacramento to the summit by way of Folsom, Latrobe and Placerville, does not exceed 110 miles; and thus it would require a regular, continuous grade of at least 63½ feet per mile from Sacramento, to reach the summit in that distance. But a regular continuous grade is impracticable. The railroad to Folsom is 22 miles long, and it attains an altitude of less than 200 feet, thus leaving an altitude between there and the summit of at least 6800 feet, to be reached in a distance of 88 miles, requiring a regular, continuous grade of more than 77 feet per mile.

So Placerville is only 1,855 feet above Sacramento, and is about 53 miles distant from the summit, leaving at least, 5,145 to be surmounted in that distance, requiring a regular, continuous grade of more than 97 feet per mile, instead of 62 feet, as stated in the article in question. Facts are stubborn things, and it requires only a plain statement to prick such bubbles as this.

IRON ORE IN NEW JERSEY.—A vein of very rich iron ore has recently been discovered at Walnut Grove. It extends across the entire farm of Isaac Coombs, and is about eleven feet wide. A portion of it runs along the surface of the ground, and from appearances can be mined for at least two years without the use of machinery. The vein contains about eighty per cent of iron ore, and is now being developed by parties who have leased the premises. Other veins have also been discovered in the vicinity.

A TIN MINING COMPANY.—The Northern American Tin Mining Company filed their certificate of incorporation on Saturday last. The company is to mine in the Mining District of Coneto, District of San Juan del Rio, in the State of Durango, Mexico. Amount of capital stock, $500,000. Duration of corporation, fifty years. Trustees—C. J. Janson, E. L. Gould, J. D. Arthur, C. J. Brenham and Thomas O. Handy.

A NEW SPIRE, 554 feet high, is building on the Church of St. Stephen, of Vienna, and will, when completed, be the highest in Europe.

[From our Supplement of Monday, October 3d.]

THE LAST DAY OF THE FAIR.

The Fourth Fair of the San Francisco Mechanics' Institute—of which this is the closing day—has been one of the most successful, both pecuniarly and in the objects for which it was primarily given, ever held on the Pacific coast. The cost of erecting a building, the largest, most beautiful and original in design, expressly for and so well adapted for the purpose, has been more than met by the liberality of an appreciative public. While as a means to the end of disseminating a knowledge of the resources of our State in the mechanical and manufacturing departments, the most sanguine could not have anticipated so large a measure of success as has attended the present Fair. The character of our people, the vast fields for their enterprise offered by the isolated character of our geographical position on the World's map; the value of labor, its immense demand, the fecundity of our soil, and every other advantage of our climate, soil and productions, had led us to expect much, very much, from the exhibition of the mechanical and manufacturing skill of the metropolis of the Pacific. But we were not prepared for so vast, varied and most extraordinary a display as may be seen at this Fair to-day. We had expected to have found many important improvements in mining and agricultural machinery, but we did not expect to find as we do, new and valuable inventions in machinery for so many novel departments of arts and manufactures. We had not expected to find our local woolen manufactures to equal, aye excel, those of England, France and Germany, which they certainly do in the quality of materials and faithfulness of finish. We had not expected to find gold beating, tin, wood, and paper box making, branches of local industry, employing so many hands and so much costly machinery. We had no idea that electro-plating, cutlery and the manufacture of boots, shoes and clothing, for exportation, formed important branches of our local business, and added much to our local prosperity. But for this Fair the world would never have suspected that in this city, we have the largest establishment in the United States for the preserving of fruits, pickles, etc., But for this Fair, no one would have imagined that in this city we have manufactories of iron, copper and brass wire, of coal oil and its kindred productions, of barrels, buckets and corn brooms, and of machinery for purposes so varied and numerous that a mere catalogue of them would fill a volume. Who would have supposed that on this newly settled portion of the world, scarce more than a decade since its first soil was upturned for the purposes of agriculture, we have the largest seed growing farm in the whole Union! The beautiful seed ranch of Wm. Perkins, of Oakland, will testify to this.

In all the branches of high art how much is there to be proud of! Where, in which gallery of modern painters are works more beautifully executed or more true to nature to be found? Where in all the world's wide bounds can we go to find larger, or finer specimens of the art of Photography, than are on exhibition at this Fair? And not to leave the ladies out in the cold—for they have done very much to add to the interest of the Fair—where could we find such a beautiful collection of articles in those branches of art they claim almost exclusively as their own, as are on exhibition here? To our mind the most suggestive and hope-bearing portions of the whole Fair, are to be found in this the ladies' department.

This Grand Temple—devoted originally to manufactures and arts, with an amount of generosity and liberality that must reflect honor on all concerned—has been turned from its noble purpose to the higher, nobler, grander one of Christian charity. To-day, dear reader, this gorgeous temple, so ornately embelished with the works of men's minds and hands, is devoted to charity—the most Godlike attribute of humanity. What you see—the music you hear—the splashing water that falls from you fountains so merrily — the refreshments of which you may partake—the gas that illuminates all around you—the police who guard your safety and the attender that keeps all in such beautiful order—all, all are given gratuitously for the relief of our fellow citizens in the southern counties of the State, whom the inscrutible ways of Providence have visited with a ruinous drought. The receipts of this, the last day of the Fair, are entirely devoted to that purpose. Than this could a more glorious finale be given to the largest and most successful Fair of the Mechanics' Institute of San Francisco?

ENGRAVING BY ELECTRICITY.—The London *Builder* describes a machine for engraving the cylinders, of copper brass employed in the printing of woven fabrics and paper hangings. Its distinctive feature is in the application of voltaic electricity in communicating certain necessary movements to important and delicate portions of the apparatus. The cylinder to be engraved is first coated on its outer surface with a thin film of varnish, sufficiently resistant to the continuous action of the strongest acids. The requisite number of copies of the original design are then traced or scratched simultaneously by a series of diamond points, which are arranged on the machine parallel with the axis of the cylinder.

Each diamond point is in correspondence with a small temporary magnet; and the entire series is so arranged *en rapport* with the original design, which had been previously etched on a metal cylinder fitted in with a non-conducting substance—this cylinder being made to revolve in contact with a tracing point,—that when the electric current passes, intermitteut currents are established, whereby the diamonds are withdrawn from their work at the proper intervals. The metalic surface is thereby exposed in certain parts; and a bath of nitric or other acid being afterward used to etch or deepen the engraved portion, the operation is completed. By means of this apparatus and mode of operating, engravings may be enlarged or diminished to any necessary extent from the same orginal.

DISCOVERY OF ANCIENT MANUSCRIPTS.—Dr. Dèthier, Director of the Austrian School, has been permitted to examine the relics of the library of Matthias Conviuus preserved in the old Seraglio. He has turned over every leaf and manuscript, spending 12 months in the work, and has discovered two manuscripts of real interest, some scholiasts of Aristotle, believed to be new, and an invaluable historical work. This is "an account by an eye witness of the exents of the reign of Mahomet the Great, of the capture of Constantinople, and in a word, of all the exciting scenes of the last 17 years of that long and eventful history. The manuscript is a beautiful one, and full of curious details."

ANOTHER CALIFORNIA PRODUCTION—RATTLESNAKE LEATHER.—The editor of the Hartford (Conn.) *Press* has been shown a new kind of leather, made from rattlesnakes' skins, sent from California. The skins have been tanned, and are to be made up into slippers. In color they are brown, marked with black. Rubbed one way they are as smooth as silk, but rubbed backwards are very rough, the scales turning up as though they had been nicked with a knife. The skins measure about six feet in length. They are very delicate and easily torn, and are only valuable on account of their novelty.

A CHEAP WAY TO CLEAN CLOCKS.—A correspondent of the *Scientific American* says that common brass clocks may be cleaned by immersing the works in boiling water. Rough as the treatment may appear, says the correspondent, it works well, and I have for many years past *boiled* my clocks whenever they stop from an accumulation of dust or a thickening of the oil upon the pivots. They should be boiled in pure or rain water and dried on a warm stove or near the fire. I write this by the tick of an eight-day clock which was boiled a year ago and has behaved perfectly well ever since.

TO VARNISH ARTICLES OF IRON AND STEEL.—Dissolve ten parts of clear grains of mastic, five parts of camphor, fifteen parts of sandarach, and five of elemi, in a sufficient quantity of alcohol, and apply this varnish without heat. The articles will not only be preserved from rust but the varnish will retain its transparency, and the metalic brilliancy of the articles will not be obscured.

JAPANING OLD TEA-TRAYS.—First clean them thoroughly with soap and water and a little rotten stone; then dry them by wiping and exposure at the fire. Now, get some good copal varnish, mix with it some bronze powder, and apply with a brush to the denuded parts. After which, set the tea-tray in an oven at a heat of 212 or 300 degrees until the varnish is dry. Two coats will make it equal to new.

EXTENSIVE IRRIGATION.

The English in India are introducing great improvements in the way of irrigation, from which California may derive some profitable hints. These works are described in the Edingburg *Review*, as already of great extent and fully commensurate in benefit with their cost. One of the chief of these improvements is the Gauges canal, which has 898 miles of main channel, with 1,852 miles of distributing water courses. It irrigates an area of 1,471,500 acres, and its benificent waters will protect from the risk of famine a tract of country containing a population of 6,500,000 souls. It is estimated that in the famine of 1860—1,339,543,840 pounds of grain were grown by the irrigations which it afforded. Other canals are from 100 to 500 miles in length, and render fertile vast tracts of land that would otherwise remain almost barren wastes. In the Presidency of Madras nearly all the great rivers have been intersected by dams, which retain for irrigation the flood of fructifying waters that would else flow out to the sea. The increased production is reckoned by millions of pounds in value. These works are constructed at a great outlay, and are justly regarded as triumphs of engineering, skill and wise statesmanship.

There are few localties more favorably located for irrigation than the valleys of California, and no portion of the globe where more important results may be derived therefrom. It is a matter of much astonishment that so little attention is paid to irrigation in this State, while such immense loss is so frequentiy sustained from failure of crops by drouth. The experience of the past year in the neighborhood of Stockton, has fully proved the value of irrigation on California soil, and we hear that a more general system is about to be inaugurated in that neighborhood, which we trust will prove the precursor of similar enterprises in other parts of the State.

The Fall in Gold.

The following extract in regard to the fall in gold appeared in the Philadelphia *North American* some five or six weeks since. It is quite as appropriate at the present moment, as when it first appeared, so much so that we reproduce it for the benefit of our readers :—

Gold goes down so steadily and so fast that the fact attracts much attention and comment. The real explanation is, that the rates could not be kept up any longer, the demand for gold having largely decreased, and the condition of commercial affairs being much more favorable to the government and the prosperity of the country. It is also true that the banking facilities, by means of which the speculation was carried on, have now been withheld so long that the bubble has burst, and gold and provisions alike come down. Coincident with this are the large subscriptions made in Germany to our securities, and the abiding faith of the German capitalists in the credit and stability of our government. This latter development has astonished the great bankers whose center is in London, and their organ, the *Times*, gives vent to its surprise and dissatisfaction. The parties in New York who have fostered the gold speculation are in connection with this London banking coterie, and perceiving now that the object for which they have been cornering the gold market cannot be gained by the compelling of our government to resort exclusively to gold bonds on whatever terms they choose to offer, they are trying to rid themselves of the mass of gold they have been carrying. The liberality of the German people has thus come most opportunely to our relief. Any one who will refer to the record will find this development in Germany caused the first real turn of the tide, and the continuance of the subscriptions to our securities has precipitated the fall in gold. The only effect exercised on the price of gold by the Chicago Convention is in showing that the war for the Union must inevitably go on ; that the peace faction is utterly insignificant, and, therefore, that the endless trouble sure to ensue upon any triumph of the peaceites is not likely to happen. The successes of Grant at Petersburg and Farragut at Mobile, with the retreat of Early and the rapid progress of recruiting, aid in the movement, which, in fact, indicates faith in the goverument.

The average price of day laborers throughout the British Isles and Europe, is about thirty-seven cents per day.

Mining Summary.

CALIFORNIA.

Sierra.—Every thing at Howland's Flat, says the Mountain *Messenger* indicates preparation for winter. Lumber is moving in all directions, and the sound of the axe and saw are heard from early morn. The diggings are surrounded with new looking timbers, and the piles of candle boxes stowed away indicate early preparation for the long winter which renders this place an extra month of his reign in the spring. At Poker's Flat, mining has been very productive the past season, and some rich specimens have been taken out. Cold Canon has decidedly improved this summer. The Fashion company have been greatly enlarging their facilities for work. The claim is considered as good as any in the vicinity. The ground is both extensive and rich. The Sierra company, near by, have connected with the Fashion by an air tunnel, which has led to important developments. The company cleaned up 300 ounces, for their last four weeks washing. The California is improving and the Table Rock pushing ahead with their tunnel.

Yuba.—The Blue Gravel Mining Company of Sucker Flat, Yuba county, recently cleaned up its sluices after a run of thirty-one days, and obtained $52,000. There are five owners in the claim, and in four months they have taken out $110,000.

Tehama.—The *Independent* says that Mr. L. A. Kelly has shipped his Quartz Mill to Copper City, and adds "We understand that a rich silver lead has been struck in the Long-street tunnel, and the prospect is, that the mill will have all the work it can do. The present capacity of the mill is four stamps which can be increased to twelve. We shall soon know the exact paying qualities of the Pittsburg rock. The teams which take up the mill will load with copper ore from the Origiual Kellinger, back."

Shasta.—A correspondent of the Red Bluff *Independent* writes from Silver City, Shasta county, that they are erecting smelting works for working the ore in that vicinity. Rock from the Jackson ledge worked $400 to the ton, silver ; Silver Creek, $40 to the ton. He says prospects look bright—they think they have a "rich thing."

Plumas.—The Quincy *Union* of the 1st instant says that the Lone Star mill, (H. C. Bidwell) eight stamps, cleaned up over $1,000 for a run of four days last week. The rock crushed was taken from the McClellan ledge, near Greenville. The Bidwell mill, four stamps, at Dixie ravine, cleaned up $600 for a run of five days. The Waterworth, Bidwell & Ogden mill, at Greenville, took out $1,200 for last week's run of five days, quartz taken from the McClellan ledge. This ledge is one of the best defined and most extensive ledges in the county, and since its purchase from Mr. Shannon has been prospected, and found to be almost inexhaustible.

The *Union* farther adds that "it has long been surmised that a rich silver vein exists in Grizzly Mountain, near Genesee. The vein appears to have been struck at last. We have seen specimens of the ore, and it resembles very much the rock taken from the Mexican mine at Virginia City. We are promised a full and complete description of the discovery of it in a short time."

WASHOE.

A full account of the late proceedings at the Gould & Curry mine will be found elsewhere.

The Anderson and Scale mill, in the cañon, about half a mile below Virginia City, has been thoroughly overhauled, and is now ready to start again. A new battery has been put up, and the old pans have been replaced by Hepburn's. The capacity of the mill has been doubled.

The Piute mill which has been in process of construction the past summer, says the *Union*, has just commenced operating. Everything worked well. This mill is owned by a company owning ground in Gold Hill proper, and will be used to crush rock from their own claim. It has twenty heavy stamps, ten Hepburn amalgamators, five separators and is to be driven by an 80-horse power Corliss engine. It will have the capacity of working about twenty or twenty-five tons of rock per day.

The original Hawkeye company continues to drive ahead on its claim, and from present appearances will soon be in its ledge. A few days since a large stream of water was struck in a drift, which was being run from its shaft at the depth of about 315 feet, but the management of the mine has been such that very little inconvenience has been experienced from striking it. The water comes from the ledge into which the miners are now driving the drift, and the company have great confidence that they will find pay-rock at the depth at which the ledge is now being opened.

The Milton company, according to the *Enterprise* have recently struck some black sulphuret ore of extraordinary richness. It has the same appearance as the richest ore from the Mexican mine. They just cut into it on Thursday of last week, and little is known of the extent of the deposit, but there is thought to be a huge amount of the same quality. The company have for a good while been sending ore to the mills, but they have never before found anything as rich as this strike, which is considered very encouraging to the various companies on the Divide.

The Mary Ann company's hands recently shut down on the work in the mine just as they struck some excellent looking rock in the drift running west from the shaft, and at a depth of 350 feet. The cause of their doing so was the non-payment of their wages, which were some three months in arrears. Some of the stockholders are quite indignant that the officers of the company should thus dishonor its credit, which they appear to think was not necessary.

The Ophir company, it is currently reported, struck very rich rock on Friday of last week. It is to be hoped that the report may prove well founded, and that the rock may prove extensive as well as rich.

The Justis company started up their new machinery on Friday of last week. The company gave quite a convivial entertainment on the occasion.

All the mills on Gold Cañon, between Gold Hill and Dayton, according to the *Enterprise*, are now in operation. Some new mills, to be driven by water-wheels, are being erected. It is rather a strange sight, continues the same paper, to an old settler to find these huge wheels revolving in a ravine which a few years since was destitute of water. Nearly the whole of the water now flowing through the cañon comes from the mines above. The quantity is increasing every year. We long ago predicted in the columns of the *Enterprise* that the day would come when Gold Cañen would be filled with water-mills. The assertion may have appeared a little wild to some at that time, but what we now see proves that it was well founded.

REESE RIVER.

The *Reveille* says that they have had a busy time at the mills for some time past. Those that have not roasting furnaces, but still depend upon the chloride ores, have become almost perfect in the management of them, making the results from large lots almost equal to the assays. The mills working sulphuret ores are crowded with orders far exceeding their capacity. The Long Island Mill is now engaged in crushing second class ore from the Isabella ; the best rock from this claim being sent to Washoe. As this is the sulphuret ore, and is worked by the roasting process, some difficulty has been encountered in amalgamating in iron pans. In consequence of this, the pans will be lined with wood, and thus transformed, as near as possible, into Veatch tubs, and the amalgamating will hereafter be done by that process. The present high state of efficiency of the mills, is the result of much experimenting, which, unfortunately, has been done in a great measure, at the expense of the miners themselves.

Since the success of the small mills at Austin has demonstrated that miners can work their rich ores without aid from the much sought capital, the miners of outside districts have followed suit, and we doubt not they will succeed to the utmost of their desires. We learn that a number of hand mills are in course of construction at Ione. They have been very unfortunate heretofore in getting their rock worked, and have met with many disappointments. With their own mills they can work their ores as they please, and also learn the art of amalgamating so that when their mills grow into gigantic proportions they may know their trade.

All the tubs that will be put in the Oregon Mill, for the present, for amalgamating purposes, are now in and in good running order. The mill will be run to its full capacity, which will make quite a difference in the shipments of bullion this month, as compared with last, and as the bullion is now being sent direct to San Francisco, Virginia City, will not in future be credited with what we send forward.

There has been put up recently, at the Oregon Mill, a fan, with pipes from the battery to a tight room, to carry off all the dust, which saves the ore and renders the mill entirely free from the clouds of dust that were always there when the batteries were at work. In a run of one battery for eighteen hours, nearly a ton of ore was saved in the dust room, which is certainly a great recommendation for the use of the fan in all other mills.

The Johnny Grove lode, on Lander Hill recently realized 168 ounces of crude bullion from the crushing of 200 lbs. of picked rock. The crusbing was done at the horse-power mill of Grove Brothers, and principally amalgamated in Salmon's propeller amalgamator. The mill of the Groves' is one of three stamps of about sixty pounds each, and was originally constructed for a hand mill, but the owners thinking horse flesh cheaper than human, added that convenience. They will add a propeller amalgamating tub in a few days, making a complete mill, very cheaply constructed, cheaply operated, and very effective.

The Buel, North Star, has been worked with decided vigor, for the last three months, under the Superintendence of John Kutz, and during that time has sent forward a large amount of bullion. The workmen have recently struck a ledge two feet wide, and very rich, which will supply paying rock for several mills.

The Power of Imagination. — Once at a large dinner party, Mr. Rogers was speaking of an inconvenience arising from the custom then commencing, of having windows formed of one large sheet of plate glass. He said that a short time ago he sat at a dinner with his back to one of those single panes of plate glass ; it appeared to him that the window was wide open, and such was the force of imagination that he actually caught cold. It so happened that I was sitting just opposite the poet. Hearing this remark, I immediately said : "Dear me, how odd it is, Mr. Rogers, that you and I should make such a different use of the faculty of imagination. When I go to the house of a friend in the country, and unexpectedly stay for the night, and having no night-cap, I should naturally take cold. But by tying a bit of pack-thread tightly around my head, I go to sleep imagining I have a night-cap on ; consequently I catch no cold at all." This sally produced much amusement by all around, who supposed I had improvised it ; but, odd as it may appear, it is a practice I have often resorted to. Mr. Rogers, who knew full well the regard and respect I had for him, saw at once, that I was relating a simple fact, and joined cordially in the merriment it excited.—*Babbage.*

New Invention.—We have been permitted to inspect a new machine, the invention of F. Darneille, Esq., of French Town, in Yuba county, which he calls Darneille's Lever Power, which, as a specimen of ingenuity and inventive genius we have seldom if ever seen equaled. It consists of a continuation of levers worked by a pendulum, which act upon a rachet wheel, and thus the machine creates a power that is indeed wonderful ; it is estimated that a power equal to a weight of one pound applied at the foot of the pendulum, will move and raise a weight of one hundred attached to the power shaft. We can readily see how this machine will work a revolution in the application of power to machinery, when we are told, and can see it plainly demonstrated that with it, a man can run a quartz mill by hand, that will be large enough for all prospecting purposes, but we can only guess at the power that it will have with steam applied, and the pendulum lever used in place of the usual balance. In such case, if the machine performs as well as the model, and we can see no earthly reason why it will not, a six-horse power steam engine would run a quartz mill of twenty-four stamps, and have power to spare. Mr. Darneille is about to apply for a patent, and for this purpose has this model and drawings at the law office of D. R. Sample, Esq., in this city. Mr. Darneille has no secret to hide in this matter, therefore mechanics and others who may desire to do so are invited to call and examine it.—*Marysville Appeal.*

Beautiful Extract.—You cannot go into the meadow and pick up a daisy by the roots without breaking up a society of nice relations and detecting a principle more extensive and refined than mere gravitation. The handful of earth that follows the tiny roots of the little flower is replete with social elements. A little social circle has been formed around that germinating daisy. The sun-beam and the dew-drop met there, and the soft summer breeze came whispering through the tall grass to join the silent concert. The earth took them to the daisy germ, and all went to work to show that flower to the sun, each mingled in the honey of its influence, and they nursed the "wee cannie thing," with an aliment that made it grow. And when it lifted its eyes toward the sky, they wove a soft carpet of grass for its feet. And the sun saw it through the green leaves and he smiled as he passed on ; and by starlight and moonlight they worked on. And the daisy lifted up its head, and one morning while the sun was looking, it put on its silver-rimmed diadem, and showed its yellow petals to the stars. And it nodded to the little birds that were swimming in the sky, and all of them that had silver-lined wings, and birds in black, gray and quaker-brown came, and the querulous blue-bird, and the courtesying yellow-bird came, and sung a coronation of that daisy.

Boston.—The value of real estate in Boston is $182,072,200 ; personal estate $150,377,600. Augustus Hemmenway is the largest tax payer, being taxed for $161,400 real estate and $2,000,000 personal estate, making a total of $2,161,400, and being 61,000 more than the amount for which he was taxed last year.

It is Impossible for editors to know ALL the merits and demerits of their correspondence, consequently the reader must not receive the opinions of our contributors as our own. Intelligent discussion is invited upon all sides and the evidence of any error which may appear will be received in friendship and treated with respect.

American and Foreign Patents.—Letters Patent for inventors can secured in the United States and foreign countries through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past year.

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the MINING AND SCIENTIFIC PRESS, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

San Francisco:

Saturday Morning, Oct. 8, 1864.

HOME FINANCES.

The condition of the money market is such as to give satisfaction to both borrower and lender. A fair inquiry prevails for legitimate business purposes, and parties seeking accommodations in Bank are supplied at 1½ ₱ cent. per month upon short time paper. Capital continues abundant and would appear to be accumulating. A branch of the Bank of British North America is now in successful operation in this city and the business of this establishment, will, it is thought, become an important feature in fiscal matters here. This introduction of foreign capital is desirable in many respects and will tend to stimulate investments in stocks and other securities. We can offer great inducements to outside capitalists and are glad to welcome them in our midst. The currency of the country is now sound and stable, and the present gold and silver standards of value are likely to be rigidly adhered to by the people of California. The fears entertained some time ago by foreigners that our country would not sustain the legality of our specific contract act, are now happily set at rest, and the country is measurably prosperous in all its interests, (many of which are increasing in importance) and a wide and productive field is open to enterprising men with capital.

A fair business was done on last steamer day in Eastern Exchange. Currency Bills, although unsettled were sold at 70@75 ₱ cent. premium on gold. Telegraphic Transfers were current at 5½@6 ₱ cent. premium and Drafts payable in coin were quotable at 3½ ₱ cent. premium.

Receipts of Treasure from the interior continue large and reach about $1,000,000 so far this month. Gold Bars are in more request and are worth 840@850; some sales are reported at 860. Silver Bars are selling at from 1 ₱ cent. premium to 2½ ₱ cent. discount according to fineness.

Legal Tender Notes have been inactive and dull this week at from 53 to 55 and closed at 54 bid by the Brokers. Our latest telegraphic advices from New York quote gold at 190.

FLUCTUATIONS IN STOCK.—Owing to the recent fluctuation in the market value of stocks, the table from the "Weekly Stock Circular," published in another column, will be found of particular interest and value. We would here remark that the labor of carefully compiling such a publication as the "Stock Circular" is hardly to be comprehended, and the deserving publisher should be liberally dealt with by those who are accommodated thereby.

HINKLE'S CRUSHER.—Two of these machines, manufactured at Steen's Novelty Works, were purchased by G. W. Holt, and forwarded to Sacramento, on their way to Humboldt, N. T., during the present week. Further information concerning these amalgamators will be found in our advertising columns.

EASTERN FINANCES.

The main features of the latest mail advices from the East are the falling merchandise and stocks, and the decline in gold which has since continued, as we are advised by telegraph. This was generally attributed to the prospect of an early peace—many persons entertaining the belief that we are on the eve of a termination of the bloody contest, not because of any abatement in the spirit or determination of the northern people, but because the overthrow of the rebellion was now deemed more certain of speedy accomplishment, than at any other period in the history of the war. We have fully demonstrated our ability to maintain the life of the nation, and the south is probably ready to accept reasonable terms and to acknowledge itself willing to come back into the Union again. The fiscal policy of the Secretary of the Treasury seems to be meeting with a fair degree of success. His last thirty million 6 per cent. loan was readily taken at a premium of 4 ₱ cent. and the public were coming forward more liberally in their subscriptions to the 7-30 currency loan.

Among mercantile classes trade was reviving and both city and country dealers were operating with more activity in view of the requirements of the ensuing fall and yet the decline in all values, alluded to above, was having a tendency to unsettle prices and to check business.

REDUCTION OF WAGES IN WASHOE.—The Gold Hill *News* says that several of the largest mining companies in Virginia City and Gold Hill have been compelled, on account of the tightness of the money market, to reduce expenses, and accordingly have established the following rates for work in the mines: Sinking shafts, and wet work, $4 per day; drifting on the breast in ore, $3.50; running a car and barrow, $3. It is said that the "Miners' League" have the matter under consideration. There was a large meeting of the League, on Tuesday evening last, held with closed doors, and up to latest dates nothing was known, outside, of the character of the deliberations or proceedings.

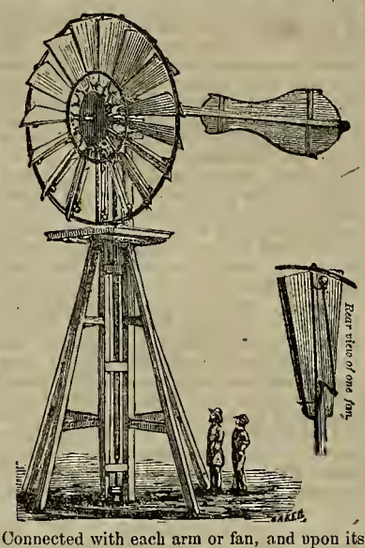
THE GOULD & CURRY MINE.—The Virginia City papers have recently published statements to the effect that this mine had been closed and that the superintendent had resigned because of some difficulties with certain employees. We have the best authority for saying that there is no truth in these reports. Regular operations have continued and the usual amount of ore has been daily taken from the mine. No difficulty is apprehended with the workmen, growing out of the late demonstration made by the "Miners' League." Telegraphic advices received last evening, mention some favorable changes in the southern part of this claim.

RETURNED.—We have had the pleasure of a call from Mr. Joseph Mosheimer, who has just returned from a protracted visit to Europe. During his absence, Mr. M. has had an opportunity to make extensive operations upon the progress of mining and mining machinery in the old world, and has endeavored to impart to our English cousins some hints on gold mining, and in doing so we notice has met with much opposition from the old fogy notions of by-gone years. Mr. Mosheimer has promised to furnish us with some items of interest, collected during his extensive European observations, which will be communicated for the benefit of our readers.

SOLD OUT.—By reference to our advertising columns it will be seen that Mr. George F. Deetken has sold out his interest in the Deetken & Co. Metallurgical Works, and now offers his services to the mining community to superintend the starting of new mills, to report upon mines, or to furnish surveys and maps thereof, etc. Mr. Deetken's long practical acquaintance with mines and mining, and his superior metallurgical acquirements, render his services especially desirable in the new sphere of usefulness which he proposes to enter.

ATWOOD'S SELF-REGULATING WINDMILL.

We herewith give an illustration of Atwood's Self-Regulating Windmill, the same which is on exhibition in the corner of the square upon which the Pavilion stands. The great excellence of this mill consists in the admirable self-regulating arrangement which has been attached to it. This is probably the most perfect arrangement of the kind ever applied to a wind mill. It is based upon centrifugal motion, and operates upon precisely the same principle as the regulator of a steam engine.



Connected with each arm or fan, and upon its outer side, is a sliding rod, running parallel therewith, upon the outer end of which is an iron ball, weighing some four or five pounds. As the speed increases, this ball has a tendency to fly off, thereby drawing upon the lever as shown in the inner portion of the sectional fan exhibited in the annexed engraving. This lever is so arranged that, when drawn, upon it *feathers* the fan, while a spring spreads it again as soon as the centrifugal force is taken off from the balls. The principle is strictly scientific and correct, and the entire mill is so simple that any person of ordinary intelligence, whether a mechanic or not, can keep it in order when once put up. We have already invited attention to this mill and would do so again, in connection with the annexed illustration. These mills are manufactured at 222 Mission street, below Beale.

PRATER'S CONCENTRATOR.—We learn from Mr. Wheeler, of Wheeler & Thayer's mill, of Sonoma, Tuolumne county, that they have been using one of Prater & Hungerford's Concentrators, at their mill with the most signal success, for some months past. The yield of the rock at their mill is $45 per ton, while rock from the same ledge, crushed at other mills, not using this concentrator, is yielding but $25. The sands from the batteries in Wheeler & Thayer's mill are received from the stamps direct into the concentrator, which effectually separates all the gold, amalgam and sulphurets from the rock with the above result.

THE STRIKE IN THE OPHIR.—Since our mining summary was prepared, we have learned that the reported "rich strike" in the Ophir was without foundation. The reporter of the Virginia *Union* having visited the mine was informed that between the sixth and seventh chambers they had struck very fair rock, yielding about $60 to the ton, but it was not as rich as that which they had heretofore taken out. The Company, however, do take out pay rock, and are sinking a new shaft; and at a certain depth expect to strike it still richer.

IMPORTANT SILVER DISCOVERIES are said to have been recently made in the Cascade Mountains about seventy-five miles from Olympia, Washington Territory. We trust our silver hunters, will not go crazy over it however. The latest "new discovery" fever,—the Sooke river—did not "take" very well, although it was "got up" after the most approved sensation style. California miners are begining to get their eyes open with regard to such things.

THE GELOGICAL SURVEY.

Professor Brewer has furnished us with the following additional particulars, with regard to the late trip of the party which recently returned from the lower portion of the State:—

The party left Visalia early in June, and worked east to the crest of the Sierra along the divide between the Kings and Kaweah rivers After passing the lower foot hills and attaining an attitude of 4,000 feet the region becomes heavily timbered with pines and firs. There are occasional meadows, and much feed is scattered through the forests, and cattle have been driven to this feed as far as seventy miles from Visalia, and up to the altitude of nearly 9,000 feet. Good feed exists beyond this, fine pasturage, extending nearly to the crest, but the country is more difficult of access and is as yet entirely uninhabited. Along the western slope, at an altitude of 5,000 to 7,000 feet the 'Big Trees' or giant *Sequoias* are abundant, not merely occurring in isolated groves, as is the case farther north, but are also scattered through the forests in abundance along with other timber for a distance of at least twenty-five miles, along the tributaries of Kings, Kaweah and Kern Rivers.

Larger trees were met with than occur in the Calaveras and Mariposa groves, and they imparted a grandeur to the forests that can only be appreciated by being seen. The largest tree seen by the party is near Thomas' Saw Mill, and is about 40 feet in its greatest diameter; but the Indians tell of a much larger tree, north of Kings River. The crest of the Sierra rises very high for a distance of more than a hundred miles, in fact, the more prominent peaks for two hundred miles, rise to above 13,000 feet. Between the head waters of the Kings and Kern Rivers the greatest mass occurs. The highest peak is probably 15,000 feet high. They found it impossible to reach the top and measure it. Mr. King reached the hight of 14,730 feet but was unable to get higher. Several peaks of this group are over 14,000 feet. This fact was unsuspected before, and makes these mountain the highest in the United States.

The party was accompanied with an escort of cavalry from Camp Babbitt, for the region north of this. They passed up the South Fork of Kings River and crossed to Owens Valley after finding it impossible to get north without this detour. Kings River has two main forks, both running in very deep cañons, that of the North Fork being impassable. These cañons are deeper than that of Yosemite and almost rival it in the grandeur of their scenery. That of the North Fork was not visited. That of the South Fork much resembled Yosemite, but lacked the grand waterfalls that make the latter valley so famous. With comparatively little labor a trail could be made by way of this fork, which would be much the shortest route from Visalia to San Carlos and Bend City. The pass is very high, some 11,600 feet, and the summit steep, still not impracticable.

The party passed up the Owens Valley about sixty miles, and then recrossed the summit by an obscure Indian trail to the Middle Fork of the San Jonquin. The pass is very high, about 12,000 feet, probably the highest pass in North America. On the South Fork of the San Joaquin, near to the summit, a large mass of slates occur, which may at some some future time raise an excitement and prove metaliferous. Near the junction of the three larger forks of this river, there is a large region which abounds in excellent pasturage. several thousand cattle might be pastured here for six months of the year, and a trail could easily be made from Fort Miller, on the south side of the San Joaquin. It would be impracticable to go on the north side as the cañon of the North Fork is very deep, at least 3,000 feet, and very difficult to cross. At the head of the North Fork of the San Joaquin is the lowest pass probably that occurs between the Sonora pass and Walkers Pass, a distance of over two hundred miles. This in the future may be a matter of more importance, but at present it offers no advantages over the Mono Pass to travelers going to Esmeralda; but could this route be opened it would greatly shorten the distance from Stockton, or Mariposa, to Owens River, Coso, Slate Range and the regions beyond.

It will doubtless be a long time before much of this region will be well known, as its only inducement to settlers is its pasturage during the summer.

GOOD PAY.—In the Main Gulch, at the foot of Main street, (says the Columbia Courier,) the Maine boys, in their last run of twenty-three days, cleaned up sixty ounces of gold.

THE CAVE IN THE GOULD & CURRY.—The cave which occurred in the Gould & Curry mine, on Saturday morning last, is described as follows in the *Territorial Enterprise*:—

At three o'clock yesterday morning quite an extensive cave occurred in the old works of the Gould & Curry mine, some four hundred feet south of the office and buildings. We visited the scene of the cave and found an immense hole on the surface, situated midway between the Gould & Curry house and the Savage Mining Company's shaft, of some fifty feet in diameter and about twenty feet deep. We learn that the caving commenced about three weeks ago, in the D street tunnel, and has since then been gradually working its way to the surface. An immense chamber in the old workings has been filled up by this cave at no cost whatever, which otherwise would have compelled the company to go to heavy expense to do so. On the other hand, however, the old spiral stairway affording access to the mine has been entirely destroyed. This cave has been anticipated for some time, and the probability of its occurence was the cause of Superintendent Bonner's placing the boilers for the interior engine on F street, instead of the spot where the cave occured, as had been originally projected. So far from doing any permanent injury to the mine, we learn that the cave has exposed new bodies of ore heretofore unknown, and which had been passed by in the old workings of 1862.

THE RUINS OF CHAMBERSBURG.—The members of both branches of the Legislature of Pennsylvania made a visit to Chambersburg to view the ruins at that place. A letter says; "The scene can never be properly described. For squares in either direction private houses and stores have been burned into one black ruin. The orders of the invaders had been to spare churches, and none of these were destroyed, except those in close proximity to residences. The fact that a Catholic Church joined the depot, was the means of saving the latter structure. The total loss to Chambersburg will reach three million dollars by actual count. The records of the courts were now being arranged in a new structure. The people of Chambersburg are returning and commencing to rebuild their dwellings. All are well supplied with the necessaries of life."

ANOTHER INVENTION.—The Northampton *Free Press*, states that L. W. Langdon, of Florence, the inventor of the Florence Sewing Machine, is building a steam carriage, adapted to ordinary roads. His experiments have thus far fully met his expectations, and he is confident of success. The boiler is now in process of construction at Woreester, and he hopes to have the carriage in readiness for trial trips in about a month. It is to be heated with coal, and he estimates that a pound will be sufficient to ran it a mile, after the steam is up.

DRY DOCK.—The Pacific Dry Dock Company filed its certificate of incorporation on Wednesday. The association is formed for the purpose more particularly of building a dry dock, with the wharves, piers, bulkheads, warehouses, machine shops, etc., which may be necessary for the prosecution of a dry dock business. Capital stock, $1,000,000, divided into 2,000 shares of $500 each. The trustees are S. F. Butterworth, W. T. Coleman, C. A. Eastman, O. P. Sutton and Edward Tompkins. The principal place of business is to be in San Francisco.

LOOK OUT FOR THEM.—Spurious greenbacks are in circulation. A stranger offered a bill for sale at the office of Messrs. Hickok & Spear, on Montgomery street, a few days since, which proved to be a two dollar bill ebanged to a fifty. The man was allowed to leave the office, but was told he could not have the bill again until he should prove that he possessed a good character. He has not yet called to prove his "character." The bill was changed by the "pasting process," a bungling piece of forgery easily detected.

THE total vote on the State Constitution in Nevada (not including Lander county, which made no returns) was 11,655. The majority for the Constitution, as officially announced by Governor Nye, is 9,087.

When are Sick,

It is now an established fact, that three or four of Brandreth's Pills are always beneficial, especially when we have a cough or cold; and in bilious and liver diseases their good effects are beyond all praise. When we feel weary, and out of love with ourselves and and the world, one or two portions of four or five pills each, will restore our health and good spirits, because they purify the blood. Sold by all druggists. 15-1w

Alcock's Porous Plaster,

The great, mild, counter-irritant remedy. The use of this Plaster is every day becoming wider. Every person who sells them has some case of the recovery of the long lost use of limbs, cured by their use. Sold by all druggists.

MINING SHAREHOLDERS' DIRECTORY.

List of Notices of Meetings, Assessments and Delinquent Sales.

Comprising the Names of Companies, District or County of Location, Amount of Assessment, Date of Meeting, Delinquent Advertisement and Sale, and the Place of Business of the Corporation if it is not in San Francisco.

REVISED EVERY ISSUE.

BLASTING

POWDER.

EDWARD H. PARKER,

No. 204 California Street,

Agent of the

Hazard Powder Company.

G. F. DEETKIN,
MINING ENGINEER.

HAVING DISPOSED OF MY INTEREST IN THE DEETken & Co. Metallurgical Works, on the San Bruno Road, I offer my services to the Mining Community, to Superintend the starting of new Mills, to report upon Mines, and furnish correct Surveys and Maps thereof.

Drawings of Mining Machinery executed in the best style of the art. Small lots of Gold and Silver Ore Reduced carefully by the best known methods.

My old friends are respectfully invited to continue the patronage which I have enjoyed in this State the last ten years. Parties wishing to communicate, can do so through J. W. McKenzie, No 406 Montgomery street. 15-tf

San Francisco, October 1st, 1864.

ATWOOD'S
SELF-REGULATING
WINDMILL.

This Windmill is the most perfect self-regulator yet invented, and is capable of being adjusted to any desired speed. Manufactured at

222 Mission Street, North side, below Beale,

SAN FRANCISCO:

N. B.—We also manufacture DICKERSON'S SELF-REGULATING MILLS; also, Rotary and Stationary Mills of different styles and prices.

222 Mission street, below Beale. 15

Illegal Advertising!

We notice many Secretaries are having their notices of delinquent sales published *weekly* in a *daily* paper. As this is a plain violation of the new law we feel it our duty to warn such parties of this error, and herewith append that section of the "Act Concerning Assessments upon the Stock of Corporations," which governs the publication of delinquent notices.

Section 9. Said notice, when published in a daily or weekly paper, or in both, shall be published as follows: When published in a daily paper, the same shall be published for a period of ten days, excluding Sundays and holidays, previous to the day of sale. When published in a weekly paper, the same shall be published for two weeks previous to the day of sale, the first publication in the weekly being at least fourteen days prior to the day of sale.

By the above extract it will be clearly seen that no delinquent stock can be legally sold by advertising in a daily papor, unless the notice is inserted *daily*.

STILL IMPROVING!

PUBLISHED EVERY SATURDAY.

THE PROPRIETORS of this useful and now important journal xperience much satisfaction in returning acknowledgements to their ardent friends and rapidly increasing patrons who have substantially contributed to the remarkable success of the PRESS during the past six months. By aid of the ACCUMULATING PATRONAGE now being properly bestowed upon the

ONLY TRUE MINING AND MECHANICAL MEDIUM

Upon this Coast, we are enabled to prove our appreciation of such marked favor by rendering the public one of the

Largest, Handsomest and Most Useful

Journals now published. With this view we shall exert our best energies, and continue to make the MINING AND SCIENTIFIC PRESS substantially

An Instructor to Prospectors,
An Economist to Millmen,
An Assistant to Active Miners,
An Economizer for Mining Advertisers,
A Reliable Reporter for Shareholders,
A Faithful Monitor for Stockdealers,
An Intelligencer for Mechanics,
An Incentive to Inventors,
A Reflector for Patentees,

And a Helpmeet to all Industrial Classes,

In fact, upon the Pacific Coast. We shall give accurate and frequent

DRAWINGS AND ILLUSTRATIONS

Of new inventions and discoveries of particular value to Miners, Mechanics and Manufacturers, their interests in this community being well considered "one and inseparable."

THE SHAREHOLDERS' DIRECTORY

Will comprise a record of all Notices of Meetings of Mining Companies, Notices of Assessments, amounts levied, date of advertising sales, and day of sales, announced in all advertisements appearing in the San Francisco papers during the period of the Volume.

STATISTICS FOR REFERENCE

And Reports of Elections of Officers of Mining Companies, Stock Reports, Valuable Tables, etc., will be continued with careful attention.

OUR PATENT AGENCY

Is increasing in importance and value to the Inventors of the Pacific Coast, as many Patentees can testify from their successful applications through us during the past twelve months.

FOR SENDING ABROAD.

As a paper for mailing regularly to your friends in the East, or to correspondents elsewhere, none can be selected more appropriate, or better calculated to dispense reliable information with regard to transpiring events on this coast and the progress of California.

Specimen copies will be sent free to those desiring to examine the paper before subscribing. Postmasters, Express Agents and News-dealers, acting as our agents, will receive liberal commissions.

Friends pleased with our efforts in the publication of the PRESS can render us essential aid by furnishing correspondence and all important information which may come under their observation, and by calling the attention of their neighbors to the commendable features of the paper; the appreciation of which favors will be duly manifested by the constant improvement of our journal.

SUBSCRIPTION IN ADVANCE.

One Year, (two volumes) $5.00
Six Months, (one volume) 3.00

FOR ADVERTISING

Our terms are very reasonable. MINING COMPANIES are especially favored by our rates, and careful attention is given to the publication of MINING NOTICES.

Mineral Statistics of Great Britain for 1863.

The mineral statistics of the United Kingdom for the year 1863, by Robert Hunt, F. R. S., Keeper of Mining Records, are nearly ready for publication. We have been favored with an early copy of the general summary of this important compilation, which we hasten to present to our readers, reserving any remarks, until the detailed statement is in our hands.

Gold.—The quantity of gold produced from two British Mines amounted to 552 ozs., of the value of £1747; the returns for 1862 being 5299 ozs., of the value of £20,390.

Tin.—The tin ore (black tin) smelted in 1863 amounted to 15,157 tons according to the returns of sales made each month by the tin smelters; the returns, as shown by the dues paid to the Stannary Court, giving 14,224 tons. This arises from the circumstance that, although the ore may have been sold in December, the dues on that ore may not be paid for a month or more after the sale. The actual increase in the quantity of tin ore raised and sold in 1863 was 830 tons; the quantity of metallic tin (white tin) produced being 10,006 tons.

Copper.—The production of copper from British mines still exhibits a falling off. During last year 210,947 tons of this mineral were produced from 222 mines, the quantity in 1862 having been 224,171 tons. This ore yielded to the smelter 14,247 tons of copper.

Lead.—The mines of the United Kingdom gave 91,283 tons of ore during the year, against 95,311 tons produced in 1862. Of lead we obtained from this ore 68,220 tons, the value of this metal being £1,418,985.

Silver.—The lead obtained gave 613,266 ozs. of silver; to this must be added 20,738 ozs. produced from ores so excessively rich in silver as to be returned as silver ores, making altogether 634,004 ozs., of the value of £174,351.

Zinc.—The production of zinc ore has somewhat increased, the quantities sold in 1863 amounting to 13,699 tons, which gave 3,835 tons of metallic zinc, of the valne of £90,889.

Pyrites—Sulphur Ores.—The quantities of these ores obtained from British mines still exhibit a decline of 95,376 tons, of the value of £62,035, being the produce of 1863, against 98,433 tons produced in 1862. The ores, however fetched a higher price.

Iron.—Of iron ores of different kinds 9.088,060 tons were obtained. This was employed in making 4,510,040 tons of pig iron, having the value of £11,275,100.

Coal.—There has been a large increase in the production of this mineral, 86,292,215 tons having been sold and used. The export trade has been less active than usual, therefore the employment of this large quantity is entirely due to the demands of British manufacturers.

General Summary of which Returns are given for 1863.

Minerals.	Quantity.	Valu .
Gold quartz.....Tons	385	£ 1,500
Tin ore	15,157	963,985
Copper ore	212,247	1,106,534
Lead ore	91,283	1,193,530
Silver ore	68	5,703
Zinc ore	12.941	29,968
Pyrites	95,376	62,035
Wolfram	13	67
Uranium.....Cwts.	3	23
Gossans.....Tons	4,424	4,576
Arsenic	1,444	1,200
Iron ore	9,101,552	3,240,890
Coal (sold and used)	86,292,215	20,572,945
Earthy minerals(estimated)		1,375,000
Total valne of minerals produced in 1863...		£29,151,976

Metals produced from British Minerals and Coals.

Gold.....Ozs.	552	£ 1,747
Tin.....Tons	13,006	1,170,702
Copper	14,247	1,409,608
Lead	68,220	1,418,985
Silver.....Ozs.	634,004	174,351
Zinc.....Tons	3,835	90,889
Iron, Pig	4,510,040	11,275,100
Total value of the above		£15,541,382
Estimated value of other metals		250,000
Coals		20,572,945
Total value of the metals obtained and coals produced in 1863		£36,364,327

The Plaza.—Mr. O'Donnell, of San Jose, proposes to adorn the plaza by settiug out a circle of evergreen trees around the fountain. On each side of the circle being half of the Plaza, he would lay off four plots, somewhat of a palm shape, preserving the walks straight and diagonally across, the latter being laid out serpentine, so as to avoid the center plot. The plan contemplates about two hundred uniform evergreens, and the fencing of each of the plots, which are to be planted with white clover and blue grass. Mr. O'Donnell enjoys a high repute, as a landscape gardener, and his plan appears to he one well worthy of consideration.

Beautiful Silver Ore.—About four thousand pounds of very rich silver ore, from the Shoshone mine, Reese River, was received by the Secretary, Mr. Newmark, a few days since, and has since been exhibited at the Company's office, on the corner of Clay and Leidesdorff streets. This ore is from an incline some 200 feet in depth, and it is supposed that it will work from $4,000 to $6,000 in silver to the ton, with a handsome showing also in gold. The company proposes hauling their first class ore to this city, for working, and reducing only second class ore at the mine.

Treasure from the North.—The steamship *Sierra Nevada* brought down from Victoria the sum of $327,462.84.

San Francisco, Oct. 13, 1863. j2tf

WHEELER'S
Amalgamating & Separating Pans.
IT IS ACKNOWLEDGED BY ALL WHO HAVE EXAMINED the principles and witnessed the operation of these Pans, that they are decidedly superior for triturating and amalgamating purposes to any other in use.
The most important principle connected with the operation of these Pans is the separation of the triturating process from that of extracting the amalgam from the sand.—The chief cause of loss of the precious metal arises from the passing off of the same in combination with the quicksilver, during the process of trituration, and in cleaning up. By the introduction of the Separating Pan to follow the triturating, this loss is entirely avoided. In working these machines there is no appreciable loss of quicksilver, and hence none of the precious metals.
Where these Pans have been introduced and operated by the side of others on sands from the same vat, the Wheeler Pans have uniformly gained a large percentage of metals, over its competitors, as well as a still larger percetage in the amount of work performed.
☞ These Pans may be seen in daily operation at the Miners' Foundry, on First street, San Francisco, where all interested are invited to call and examine for themselves.
no16-tf ZENAS WHEELER.

Hepburn & Peterson's
AMALGAMATOR.
THE SUBSCRIBERS WOULD CALL THE ATTENTION of the Mining Public to their Reducer and Amalgamator, and also to their Separator for reducing and separating the mineral from
Gold and Silver Ores,
Manufactured and exhibited at the Vulcan Iron Works, Nos. 137 and 139 First street, San Francisco.
These machines secure to the Miner a more Expeditious and Perfect Reduction and Amalgamation, a less liability to accident and delay, and a greater amount of useful effect in proportion to the power employed to keep them in operation than any other machine now in use for producing similar results. This fact is attested to by their general adoption and preference at all the principal Reduction Works in Nevada Territory; among which may be mentioned the Gould & Curry Mill, the Silver State Reduction Works, Zephyr Flat Mill, Ploucer Mill, Eastern Slope Mill, Phœnix Mill, etc.
☞ This Amalgamator may be seen in operation at Kustel Bros. works, Bryant St. between 3d and 4th.
[Illustrated in the Mining and Scientific Press, April 9th, 864.] HEPBURN & PETERSON.
nov8 3m*

To Quartz Miners.
ALL PERSONS INTERESTED IN MINING MACHINery are invited to call at the Pacific Foundry and examine my Improved Amalgamator. It is unquestionably superior to anything now known for amalgamating Silver and Gold. It works 1000 pounds at a time, and will amalgamate over three tons a day. By the motion of the revolving muller, the pulp is drawn through its center and passes under it, between the grinding surfaces, to the circumference; from whence it passes again over the muller to the center, through the holes and between the grinding surface to the circumference as before. This a constant circulating of the pulp is kept up, bringing the particles of ore again and again under the muller, and reducing the whole mass to an impalpable powder.
No quicksilver lies between the surfaces to be ground, but at the circumference and center of the pan where the metal must pass through it as the pulp circulates.
A patent was granted for this Amalgamator in December last, and all persons are again warned aginst purchasing machines made at the Miners' Foundry, called "Wheeler's Amalgamator," as they are an infringement on my patent, and a suit is now pending in the U. S. Circuit Court against the parties infringing. My Amalgamator can be seen running at the Pacific Foundry, where all can judge of their operation and the very superior style in which they are being manufactured. THOMAS VARNEY.
sep21

PRATER'S
PATENT CONCENTRATOR.
THE PROPRIETORS OF THIS NEW CONCENTRATOR, having completed arrangements for its manufacture at the Fulton Foundry, in this city, now offer it to the public, with the fullest confidence that for the purpose for which it is designed
It Has No Equal in Use.
The principle of this machine, which is designed for a Concentrator exclusively, is entirely new. It is designed for separating finely divided quicksilver, amalgam and gold from the sands, and for concentrating and saving the sulphurets, and is to be placed behind all or any other machine in use.
This machine is now running on waste sands, from which it is taking out an average of 3½ pounds of quicksilver for each ton of sand. Orders or letters of enquiry may be addressed to
HUNGERFORD & PRATER, Proprietors.
San Francisco, April 1st, 1864. 14v8-tf

Disney's Cylinder Amalgamator.
The Cheapest and Best.
DISNEY'S CYLINDER AMALGAMATOR, WHICH HAS recently been introduced to the public, has already been proved a complete success, and can be furnished, at a price cheaper than any other in use. It is simple in construction, and so arranged as to do a large amount of work with the smallest expenditure of power. The proprietor is satisfied that he can do more work in a given time and with a given expenditure of power than any other amalgamator in use. For small companies who desire cheap yet effective machines, none can be more desirable.
It may be seen in operation at the Rail Road Foundry on Fremont street where
A NEW CRUSHER
Is in operation and he can crush and Amalgamate at the LOWEST RATES. Miners and all others interested are invited to call and examine for themselves.
M. DISNEY, Patentee.
San Francisco, June 23, 1864. 1-3m

SOMETHING ABOUT WHALES.—In connection with the recent "whale show" on the sea beach, near this city, the following paragraph, containing some information in regard to these monsters of the deep, may not be altogether without interest :—

Sperm Whales belong to the polygamy class, are not matched or go in pairs, as in the case with the right whale. They are of a chocolate color, and when undisturbed, are very frequently found in large 'schools,' which are generally cow whales, protected on the outskirts by two or three enormous males called 'old sojers.' These sail in among the school alternately at railroad speed, and sometimes meet with queer receptions from harpoons laying in wait for them. It is said that some of the old sojers are a dread to all whalemen, and which are shunned on the least suspicion. The tunnage of a full-grown whale is enormous. When a carcass of one is disposed to sink, no cable of iron or rope has ever been known to sustain it. When harpooned, and not badly hurt, they settle down generally about one thousand fathoms before they move off or rise to the surface; hence all the lines of the boat are required for paying out. The head of a large sperm whale will weigh about thirty-five tuns, and forty-five barrels of pure spermaceti have been taken from his case, which is a mere vein in his head compared with the remaining part, which consists of four-fifths of the head, and is called 'white horse,' a sinewy gristle which is impenetrable to a sharp axe. Large copper bolts have been found imbedded in the heads of some of them, caused by the attacks and destruction of vessels on the surface, or plunging at the wrecks on the bottom of the sea.

HORSE POWER.—The Reese River miners are quite ingenious and active in improvising cheap motive power for their little prospecting mills. The latest phase which their ingenuity has taken, is the construction of home made horse powers. The *Reveille* of the 30th ult. says :—

"About three weeks since, Johnson & Co. built a horse power for their four-stamp quartz mill, near the district school house, in the Third Ward, and met with such good success with it, that two other persons, engaged in the same business, had horse powers built immediately, and one is now in successful operation. Yesterday, still another one was commenced by R. A. Brown, and will be put up nearly north of Bradford's Hall."

WEATHER REPORT.—Dr. Logan, of Sacramento, in his weather report for September thus speaks :—"Nothing worthy of special note has occured during the month beyond the ordinary changes attendant upon the regular progression of the seasons. The temperature has been rather above the average. This has been felt more sensibly than the instrumental measurement would indicate, in consequence of the dying away of the southerly breezes towards sundown, and the consequent stagnation of the air, during the intervals of our hours of observation. This sultry condition of the evenings is peculiar to the Autumn of California. It is to soon yet to make any calculations as to the approaching rainy season, but so far as the commonly accepted signs go, the indications are favorable for a wet Winter."

UNPARALLELED.—The wife of Jose Castro, of Monterey, has given birth to thirty-six children, all of whom are living together in that county. The first twenty are twins, each pair representatives of either sex. Of the remaining children, eleven only were singly born. A yearling calf is eaten at a meal by this family, and for dessert they usually consume an enormous quantity of frijoles. It is safe to say that a more prolific couple cannot be found on the globe. At least, a parallel instance is not a matter of record.

A RICH DISCOVERY.—The Esmeralda *Union* is informed that the employees of the Del Monte company found, the other day, concealed in the mine, twenty sacks of exceedingly rich ore, which had been placed there by parties engaged in the mine, for a dishonest purpose. The estimated value of the rock is four thousand dollars. The Del Monte company is always prompt in paying the men in its service, and we are glad the thieves, whoever they are, failed to make a raise at the expense of that company.

APPLICATION OF THERMO-ELECTRICITY.—Mr. Bryson has recently exhibited at the Scottish Society of arts a very beautiful application of thermo-electricity, which will enable a ship, even in the darkness of fog or midnight to determine the proximity of icebergs. Dr. Strethill Wright conducted the experiments, and astonished the society by firing a miniature cannon by a lump of ice. We believe the Cunard Company have offered Mr. Bryson every facility for testing his invention on a large scale.

THE PACIFIC IRON WORKS,
First & Fremont Sts., between Mission & Howard, San Francisco.
The proprietors of the above works, invite the attention of all parties interested, to their greatly improved and unequaled facilities for manufacturing Steam Engines and Boilers, both Marine and Stationary, of any required size and pattern, Quartz Mills, Amalgamating, Pumping and Hoisting machinery of the most approved construction, Flour, Saw and Sugar Mills, Water Wheels, &c., &c. Our pattern list is most complete and extensive, embracing the late improvements in all classes of machinery adapted to use on this coast. We would call especial attention to the fact that we have secured the exclusive right of manufacture for the Pacific Coast of the celebrated Greene Engine, conceded to be the most economical and perfect working Engine now in use. We are also exclusive manufacturers of the celebrated Bryan Battery, Varney's Amalgamators and Separators, Ryerson's Superheated Steam Amalgamators and Rotary Crushers, Stone Breakers, &c., &c. Orders respectfully solicited.
GODDARD & COMPANY.

VULCAN IRON WORKS CO.,
[ESTABLISHED 1850.]
No. 137 and 139 First Street,
IRON FOUNDERS, STEAM BOILER MAKERS AND
STEAM ENGINE BUILDERS.
THE Machine Shop possesses the greatest number and the largest dimentions of Tools in the State. They have Lathes to turn nine feet in diameter and thirty feet long. Their other facilities for executing work rapidly and efficiently are unsurpassed. Upwards of 300 STEAM ENGINES, made at their own Works, are now running in this State and Oregon, in Steamboats, Quartz Mills, Saw and Flouring Mills. Their BOILER WORKS have turned out upwards of 600 STEAM BOILERS of all kinds.
MACHINERY
Quartz Mills, Flour Mills, Hydraulic and other Presses, Hoisting Machines, Gearing Pullies, Gudgeons, Boxes, Hangers, etc., in Great Variety.
Quartz Stampers, Shoes & Dies,
Warranted to be made of the very hardest and toughest Iron.
RAILROAD MACHINERY, LOCOMOTIVE, CARS, CHILLED WHEELS AND TIRES, ETC.
A Published list of the Patterns of these Works will be sent on application.
MANUFACTURERS OF
JONVAL'S TURBINE WATER WHEELS,
The Cheapest, most Portable and Effective Machine ever invented for the application of Water as a Motive power. These Wheels are made entirely of Iron, simple, and not liable to get out of order.
☞ A DIPLOMA was awarded to this Company for the *Best* California-Made *Steam Engine*, by the Mechanics' Institute, September, 1857. 13

IMPROVED WATER-WHEEL,
—PATENTED BY—
JOHN TYLER, WEST LEBANON, N. H.
Giving the Maximum Power with the Minimum Cost; Having the Following as Some of Its Advantages Over Others—Giving the Best Percentage of Water Used, Durability,
It runs Equally as well IN Back Water as OUT.
IT IS ADAPTED TO HIGH HEADS OR LOW—IT IS NOT LIABLE to get out of repair—It can be put to running by any Machinist in a very short time—It is the steadiest running and easiest regulated wheel in use—There are now some 500 of them in use in the United States and Canadas, running under all heads, from 4 to 80 feet, and giving universal satisfaction. Address
SMITH & HANSCOM,
15v3-3m Golden State Iron Works, San Francisco.

DUNBAR'S
PATENT SELF-ADJUSTING
Piston-Packing.
Requires no Springs or Screws; Is always Steam Tight, without excessive friction, and never gets slack or leaky.
IT WILL SAVE EACH SEASON MANY TIMES ITS COST in friction, time, steam and power. No engine, old or new, should be without it. It can be easily fitted to old or new Pistons.
Having obtained the Agency of this VALUABLE IMPROVEMENT, I am prepared to furnish it wherever desired. For further information, address HENRY S. SMITH,
23v8 Golden State Iron Works, San Francisco.

LEWIS COFFEY. J. S. RISDON.

HARRISON'S ECCENTRIC PUMP.
This pump is designed for throwing large quantities of water, either as a wrecking pump, a mining pump, or for irrigation. Its principal advantages are that it is light and compact, very durable and not at all liable to choke or get out of order.
It has no valves and no packing. It is a suction and force pump, and has sucked water up over 27½ feet.
It can run fast or slow, and according to its speed is the quantity of water discharged.
All sizes, capable of throwing from 100 to 6000 gallons per minute. For sale by **C. H. HARRISON,**
21 Phœnix Oil Works, 517 Front Street, S. F.

The Daily Evening Express, at Victoria, Vancouver Island is published by Messrs. Wallace, Allen & Hardyngc. Terms of subscription: One year, by mail, $10; six months, $6. It contains the late Mining, Commercial, and General News, up to the hour of going to press. Being the ONLY EVENING PAPER published in Victoria, and having a circulation equal to any other Journal in the Colony, it will be found an excellent medium to enable advertisers to bring their notices before the Public.
W. H. TOWEY,
Agent, Government House, San Francisco. 15-tf

GRAFTING ANIMALS.—The *Intellectual Observer* says :—"Dr. Paul Bert has published a work on the curious subject of animal grafts. He succeeded in making Siamese twins of a couple of rats, and in many other monstrosities. He exclaims, 'it is a surprising spectacle to see a paw cut from one rat, live, grow finish its ossification, and regenerate its nerves, under the skin of a dog, what a miracle to see the interrupted vital phenomena resume their course, and the fragment of a bird receive nourishment from the blood of a mammal.'"

PLACER MINING IN WASHOE.—Although the placer mines of Gold Cañon were thought to be about worked out some time ago, says the Gold Hill *News*, yet we saw, a few days since, some men at work with rockers, after the old primitive California style, and on inquiry we ascertained they were doing pretty well, making from three to four dollars per day to the man, which is not so bad these hard times. Where these men were working is near the mouth of the cañon, just above the lower toll-gate, and in a locality that has been worked considerably in years past. There are undoubtedly numerous other places in the cañon that would pay yet.

A COLORADO GOLD NUGGET.—A nugget of gold, weighing 80 pounds, was recently on exhibition at Chicago, Ill., which was taken from the Brigg's Gold Mining Company's claim in Colorado. The nugget is valued at $44,000, and is described as a splendid specimen.

MORE COPPER.—The workmen in the Keystone Copper claim, at Copperopolis, have struck ore of the richest kind at the depth of two hundred and fifteen feet.

ABEL STEARNS, the great stock raiser of Southern California, has failed. His losses in cattle, caused by the drouth, have been enormous. He numbers them by thousands.

No less than twenty freight engines on the Western railroads have recently been altered so as to burn coal, it having been found that this is a cheaper fuel than wood. Ten more are in the work-shops to be altered in the same way.

CHRISTIAN COMMISSION FAIR.—The ladies of Sacramento open their Fair for the benefit of the Christian Commission in that city, on the 13th instant. They solicit contributions of articles for exhibition and sale.

BROOMS.—Great Britain imports brooms from this country. A large manufacturer in Chicopee, Mass., supplies heavy orders for London and Birmingham.

IN TURKEY, whenever a storekeeper is convicted of telling a lie, his house is painted black, to remain so for one month. If there were such a law in force in this country, what a somber and gloomy appearance some of our cities would present!

AN OVERTASKED MIND.—Aaron D. Patchen, one of the wealthiest men in the State of New York, died at Buffalo, recently, an idiot. He had overtasked his mind with cares and riches.

THERE are two classes of intellectual men in this world; one which tells you all they know on a first acquaintance, while the other is like a continual fountain—always supplying some information which you have to draw from them.

IT is stated that in the first two years of the present war 2800 walnut trees were felled to supply a single European manufactory of gunstocks for the American market.

DIVIDEND.—The Pacific Insurance Company have declared a dividend of six dollars per share, or six per cent on their capital stock.

VELOCITY OF MECHANISM.—A 60-inch fan running 4,000 revolutions a minute, has a velocity at the periphery of 1,100 feet per second. This is just about the average velocity of cannon balls.

TO PRINTERS.—*By our little Joker.*—Why are the rebels in the Southwest like *rats?* Because they are trying to work their way into Missouri *under Price.* Query—Will they be admitted into the *Union?—Folsom Telegraph.*

COPPER MINERS FOR LAKE SUPERIOR.—"Four hundred and seventy-eight Swedish emigrants, principally miners, have just arrived in Quebec, on their way to the Lake Superior copper mines."

BANK OF CALIFORNIA.—The following persons were on the 4th inst., elected Trustees of the Bank of California for the ensuing 12 months: D. O. Mills, W. C. Ralston, J. B. Thomas, Louis McLane, John O. Earl, Thomas Bell, James Whitney, Jr., William Norris, O. F. Griffin, Herman Michels and A. J. Pope.

TWELFTH YEAR OF PUBLICATION.

THE GOLDEN ERA,

Founded in 1852.

The oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent, and correspondents of distinguished ability in New York, Paris and London.

THE GOLDEN ERA is now enlarged by the addition of eight columns to its pages—and presents fifty-six columns containing the greatest possible variety of Valuable and Entertaining, Original and Selected Matter, all combining to render THE GOLDEN ERA a Literary and Family Journal of surpassing interest and attraction; a Welcome Guest in Cottage and Cabin; the favorite at the fireside in City and Country, the most useful, agreeable altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe, and elsewhere. Every Household in the Mountains and Valleys, the Cities, Towns, and Mining Camps of California and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor.

"THE DOCTOR'S WIFE," now in course of publication in London, is universally pronounced to be Miss Braddon's greatest production. It will be completed in sixteen numbers of THE GOLDEN ERA.

HUNT'S IMPROVED WIND-MILL.

THIS WIND-MILL IS RAPIDLY taking the place of all other Mills on the Pacific Coast. These Mills are so simple in their construction, that when once built, they can be put in order by almost any person; and when once in order they will run for years without repairs.

Prices, from $50 to $1,000.

ROUND AND SQUARE WATER TANKS BUILT TO ORDER.

HUNT'S PUMPS

Are admitted to be the best in the Market for Wind Mills, being built expressly for that purpose. They can be set, and taken apart with a common wrench, and are very easily repaired.

HUNT'S ENDLESS CHAIN

HORSE POWER

For Sawing Wood.

ALSO, THE

Self-Regulating Horse Power

Is so arranged as to give a steady motion, and is calculated to be used for turning Wood, Iron or Brass, also for Scroll or Circular Sawing, and is fully equal to Steam for any light work. The above Machines are built of the best materials, and made as Durable as Wood and Iron will make them.

ALL WORK WARRANTED.

☞ For further Particulars see small circulars. ☜

Worth Considering.—Advertising has proved the medium of success to many of the most prominent business men of the world. Merchants, Inventors, Builders, Patentees, Manufacturers, Foundrymen, Machinists, and, in fact, all who wish to call the particular attention of the Mining, Professional, Mechanical and Industrial members of the community to their business, should not fail to advertise in the MINING AND SCIENTIFIC PRESS. The circulation of the paper is extensive, and has a wide range, reaching the most intelligent readers in every mining settlement of importance on the coast. A large number of copies are also sent East. Our terms are reasonable. "Live and help live" we believe to be a sensible motto.

THE *Mining and Scientific Press* makes its appearance upon an enlarged sheet. The *Press* is by far the best scientific paper ever published on the Pacific coast. Its contents exhibit both industry and ability. We wish it continued success.—*Washoe Herald.*

SCIENTIFIC AND MINING JOURNAL.—This is as valuable a publication as is produced on the Pacific Coast, and one which interests all parties. It contains much that is instructive and entertaining, and seems to have the right men at the head of its affairs.—*Spirit of the Times.*

MINING AND SCIENTIFIC PRESS.—This well conducted journal has entered upon its ninth volume. It is a sterling periodical, and deserves encouragement.—*Territorial Enterprise*

IMPORTANT DISCOVERY

— IN THE —

Photographic Art.

Jacob Shew's

CHROMATIC PROCESS OF PRINTING PHOTOGRAPHS.

[PATENT APPLIED FOR.]

THE UNDERSIGNED WOULD ANNOUNCE TO THE public that he has discovered a new and IMPROVED PROCESS for printing Photographs, which produces a

SOFTNESS, CLEARNESS AND DELICACY OF TONE

unattainable by any other known process and to which he has given the above name. It is applicable to any size of Photograph, and those having valuable old negatives which they desire printed by the improved process can do so at any time.

In order to secure the pecuniary advantages to be derived from this important discovery a patent has been applied for. When obtained, the privileges of the right will be disposed of at a reasonable rate to any Photographer desiring it. In the meantime all are warned against encroachments upon the rights of the discoverer as such will be prosecuted to the full extent of the law.

"Cartes de Visite" and large Photographs printed by this process will be furnished at the prices of the ordinary work of other establishments.

☞ The public are invited to examine specimens at my Gallery. ☜ **JACOB SHEW.**

No. 44 Leidsdorff street, opposite the What Cheer House,
12-tf San Francisco.

A Much Needed Invention.—Heretofore the numerous evils arising from shrunken doors and windows have had to be patiently submitted to. The stuffing of the appertures with list, carpet strips, etc., have been found altogether insufficient to answer the desired purpose. In order to obviate and overcome this serious inconvenience and produce a sure preventive, "Brown's Metallic Weather Strips and Window Bands" have been introduced and are warranted to exclude dust, wind, rain, heat or cold. They prevent the clattering of sashes and produce the same effect on all doors and windows. In stormy weather they make your house an Elysium, when without these applinnces it would be more like Pandemonium, especially to a nervous person. They are so cheap and simple that they come within the means and reach of all, and we donbt not bat that the housekeepers of San Francisco will hail with joy an invention that will save them so much labor, secure them neat and quiet dwellings, and keep the temperature therein uniform and pleasant. They are peculiarly adapted to this climate, and those who are troubled with leaky doors or windows would do well to examine this invention before the advent of the approaching rainy season. The invention is highly recommended by all who have used it, and where entire satisfaction is not given no pay is required.

*

R. A. Swain & Co.—We would call attention to the splendid show of French Crockery and other elegant fancy ware, made by this firm at the Pavilion. This house is one of the oldest in the city, having been established in 1852, by Mr. Swain the present senior partner. In the early part of 1854, Mr. William J. Mack, became a member of the firm, which then assumed its present style. They have recently erected a magnificent fire proof edifice at the corner of Pine and Sansoms streets, where they now display one of the largest and most complete stocks of goods in their line ever offered on the Pacific coast. Our space will not admit of an enumeration of the varied and magnificent articles which they offer for sale; hence we would invite our readers to visit their establishment and examine for themselves. You will find it a perfect museum of wares in their line of business, and whether you purchase or not you will be courteously received by the gentlemanly proprietors, who will spare no pains to render your visit both agreeable and profitable.

The Gold Hill *News* says it is rumored that the Gould & Curry and the Savage had combined and purchased the title to the North Potosi mine.

A Locomotive on a trial trip passed on the 15th of July from Spain into France, across the mountains. More than sixteen miles of tunnel had to be traversed.

Sailing of the Steamer "Sierra Nevada."—The sailing of the steamship Sierra Nevada, for Portland and Victoria, has been deferred to Tuesday morning next at 10 o'clock A. M.

Matrimonial.—A Washington correspondent says it is rumored that Gen. A. M. Winn, formerly of Sacramento, and Mrs. James King of William are to be married.

Geo. Reynolds, a native of Cornwall, England, fell down a shaft on the Napoleon claim, near Copperopolis, Calaveras county, on Saturday last, and was instantly killed. The shaft was 50 feet deep.

Large Tax.—It is not generally known that the last Congress levied an income tax of five per cent. in addition to the three per cent. tax, yet such is the case. Those having incomes over $600 a year, besides house rent, must pay a tax of eight per cent. thereon. This tax is on the incoms of last year.

Fire.—For several days past the woods on the mountains around the city of Nevada have been on fire.

Dry.—Water is so searce in Nevada that none is to bs had for sprinkling the streets.

[The mining community begin to appreciate our reasonable rates of advertising, and are turning their patronage to the journal most properly entitled to receive it. The advantage to shareholders of having all mining notices concentrated in one mining journal, is obvious to all, and our terms have been established with a view to effect such a consolidation; and most companies having an object for publishing in any other particular paper, can consequently afford to have their notices appear in our journal also.—Eds. Press.]

Advertising Circular.

The Proprietors of the Mining and Scientific Press would call the especial attention of Mining Secretaries, Trustees and Shareholders, to a few substantial reasons for the publication of Mining Notices in their journal—the first and only important newspaper of its class published upon this coast.

1st. The Press enjoys a large and permanent subscription list, having a more universal circulation among shareholders and men intimately connected with mining interests than any other publication.

2d. Under the present law the publication of all mining notices on Saturday, in a weekly journal, complies as fully with the statutes as a daily publication. It is generally found to be equally as convenient for secretaries, and decidedly preferable to stockholders who have not time to examine throughout every issue of a daily.

3d. Economy in mining should always be looked upon with favor, and the cost for weekly advertising in the Press is less by one half than the rates of any other journal in this city possessing a respectable circulation.

4th. The publishers of the Press, making the mining interest their especial care, take particular pains to assist in the avoidance of errors in advertising. Our print is also more clear and perfect than can be expected in such papers as are hurriedly issued from cylinder presses.

5th. Our "Shareholders' Directory" forms a complete index of all mining notices published in San Francisco, by reference to which shareholders can at once see if their company is advertised, and determine whether the same is inserted in the Press or some other paper.

6th. Many copies of the Press are bound by prominent professional men, mechanics, secretaries, brokers, shareholders and others, as an important record for future reference, thereby rendering advertising, of every class, in its columns, of peculiar and permanent value.

7th. The benefit of having all mining notices consolidated in one newspaper, for the common convenience of shareholders, secretaries, and others who have occasion to refer to the same, is obvious. With this view we have established our rates at only fair, living prices, believing that a journal like ours, untrammeled by party, creed, or prejudice, is the only medium which can reasonably ask for such a consolidation of mining patronage.

8th. Our rates are uniform as well as moderate. Advertisements will be taken from the forms and printed on slips or as circulars, for sending personal notification to stockholders, whenever desired, at $1 per hundred.

9th. Advertisements in the columns of the Press, after their first insertion, are arranged alphabetically. Our present list is equalled only in one instance by that of any other journal. Shareholders, as well as strangers, naturally turn their attention to a mining journal for information concerning the mines and mining matters.

10th. Blanks for filling out advertisements of assessments or notices of sale are furnished gratis. Our rates of advertising, and any other information desired, will be freely given upon application at the office.

Last, but not Least.—Our sheet (having been recently enlarged to the size of Harpers' Weekly) is now only equalled in its dimensions by one mining paper in existence—the *London Mining Journal*. Published in this, the greatest mining field of the world, we desire that the Press shall have no superior. We can only realize our cherished object of building up a reliable advocate of the science and business of mining, which will be of just honor and profit to our community, by experience and liberal patronage. The bestowal of such favors only as naturally belong to us, and which it is clearly for the benefit of the mining fraternity to extend, is all that is requisite, and we are confident we shall receive it.

DEWEY & CO.,
Publishers of the Mining and Scientific Press, Nos. 56 & 57 Government House, Corner of Washington and Sansome streets, San Francisco.

For Advertising Assessments on Saturdays.

Levy your Assessments upon any day Except Friday.

Advertise the Assessment Notice on the First Four Saturdays succeeding the day upon which the assessment is levied.

Appoint the day for advertising the Delinquent Sale on the Fifth Saturday succeeding the date of levying the assessment.

Appoint the Day of Sale on the Seventh Saturday succeeding the date of levying the assessment, or any day *previous* to the Eighth Saturday.

Assessments ordered upon Saturday afford the Secretary the longest term in which to effect his advertising at the mine.

Extracts from the Statutes.

The attention of companies who desire advertising their delinquent sales in any other paper than that in which the notice of assessment appears, is called to the following section of the law approved April 4th, 1864:

Section 7. If any portion of the assessment mentioned in said notice shall remain unpaid on the day specified therein for the publication of the notice of sale, the Secretary shall, *unless otherwise ordered by the Board of Trustees*, cause to be published in the same papers in which the notice provided for in section five shall have been published, a notice substantially as follows, &c.

If, from a matter of convenience or necessity, the publication of an assessment is delayed, a very simple remedy is found in the following section of the law, relating thereto:

Section 14. No assessment duly levied shall be rendered invalid by a failure to make proper publication of the notices hereinbefore provided for, nor by the nonperformance of any act required to be performed in order to enforce the payment of the same; but in case of any substantial error or omission in the course of proceedings for collection, all previous proceedings, except the levying of the assessment, shall be void, and publication shall be begun anew.

Our Patent Agency.

The Patent Agency of the Mining and Scientific Press has been signalized with remarkable success during the past two years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of Letters Patent from the United States and foreign Governments cannot be over-rated, and the Proprietors of the Press, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

How to make your Remittances.—In most of the mining towns, bankers will furnish checks on San Francisco at par, (or at a very slight advance) to those who wish to pay us for subscriptions, advertising, mining blanks, etc. When it is more convenient, money may be remitted by mail at our risk if the parties sending will register their letters. Money sent by mail is seldom lost if properly enclosed. An excellent method is that of opening the layers of a card, placing the coins between the layers and sealing the edges together.

Enlargement.—The Mining and Scientific Press has again been enlarged by the addition of a fourth column to every page. It is conducted with ability and enterprise, and is meeting with the constantly increasing patronage which it deserves. There is a straightforwardness and fearlessness about it which we admire.—*S. F. Leangel.*

GREAT TRIUMPH
—OF THE—
FLORENCE!

We, the undersigned, have each purchased a FLORENCE SEWING MACHINE and have them now in use.

We have thoroughly tested them on work of all grades—heavy, medium and light—and our opinion is that the Florence is durable, will not easily get out of order, is strong and simple in construction, and its use is easily learned by the most inexperienced.

It will do a greater range of work, with less trouble and change, and we consider it altogether better than any other Family Sewing Machine we have ever seen:

Mrs. Dr. Chase, 31 Turk street, S. F.
Mrs. D. B. Coffin, 20 Clay street, S. F.
Mrs. J. B. Wooster, 525 Folsom street, S. F.
Mrs. S. D. Gilmore, 518 Folsom street, S. F.

John Herzinger, Nevada City.
H. Maekie, Nevada City.
P. Brunstiter, Grass Valley.
O. C. Shorey, Seattle, W. T.
D. Horton, Seattle, W. T.
Henry Jackson, Watsonville, Santa Cruz co.
Mrs. Albert Bader, San Andreas.
Mrs. Newton Damon, dress maker and tailoress, Seventh street, between Bryant and Brannan, San Francisco.

Previous to purchasing the Florence I owned the Howe Sewing Machine.
MRS. J. CRAWFORD,
Copperopolis, Calaveras county, Cal.

I used the Sloat Eliptic Machine six months previous to purchasing the Florence.
MRS. MARY CAFFEY,
Dressmaker, 16 Post street, San Francisco.

We, whose names follow, owned and used the Grover & Baker Sewing Machine previous to purchasing the Florence:
Mrs. Mary A. Merchant, dressmaker, 810 Stockton street, San Francisco.
Mrs. B. Weller, dressmaker, 406 Dupont street, San Francisco.
Mrs. Chas. Uznay, 419 Bryant street, San Francisco.
E. A. Love, Aagel's, Calaveras conaty, California.
Mrs. M. J. Roberts, 646 Howard street, San Francisco.
Mrs. L. H. Bayley, Portsmouth House, San Francisco.
Mrs. Julia Lyons, Target street, near Tehama, San Francisco.
Mrs Harriet Howes, 625 Post street, San Francisco.

We, whose names follow, owned and used the Wheeler & Wilson Sewing Machine previous to purchasing the Florence:
Mrs. J. D. Blain, Hubbard street, near Howard, San Francisco.
Mrs. D. S. Ruggles, 414 Folsom strsot, San Francisco.
Mrs. M. Young, 211 Stockton street, San Francisco.
A. M. Flint, C. L. Flint, San Juan, Monterey county, Cal.
Mrs. C. P. Jackson, El Dorado, El Dorado county, Cal.
Mrs. C. L. Taylor, 512 Dupont street.
Mrs. Sarah E. Miller, Sacramento.
Mrs. A. Nash, corner Stevenson and Third streets, San Francisco.
Mrs. Thomas Mitchel, Mokclumne Hill, Calaveras county.

The following named persons owned and used the Singer Sewing Machines previous to purchasing the Florence:
Mrs. A. J. Turner, 320 Beale street, San Francisco.
Mrs. H. B. Oshorne, 612 Powell street, San Francisco.
Mrs. Annie Dailey, Bush street, below Stockton, San Francisco.
Augustus Brown, 134 Sutter st., San Francisco.
Mrs. F. Scherb, 673 Mission street, San Francisco.
Mrs. Sarah P. Vick, dressmaker and seamstress, 109 Stevenson street, San Francisco.

I have found the Florence to be all that I anticipated. It has never been out of order, nor ever has "spells," like most machines of other manufacture, several of which I have owned. I can conscientiously recommend the "Florence."
Mrs. Albert Bader.
San Andreas, May 17, 1864.

The Testimony of all purchasers of the Florence is but a repetition of the opinion of the few whose names are given above.

As our competitors have not deemed it advisable to exhibit their machines at the present Fair, to be tested by the side of *The Florence*, and as there are many strangers in the city, who contemplate purchasing sewing machines, who prefer (and we earnestly request them to do so) to see and compare the merits of all before they make their selection, we give below, for their convenience, the location of the principal Sewing Machine Offices in the city.

LOCK STITCH MACHINES.

Wheeler & Wilson's, office, corner Montgomery and Sacramento streets.
Singer's, 139 Montgomery street.
Ladd & Webster's, 32 Montgomery street.
Howe's, 3 Montgomery street.
Williams & Orvis', corner Jackson and Battery streets.

CHAIN, LOOP, AND "EMBROIDERY" STITCH MACHINES.

Grover & Baker's, office, 329 Montgomery st.
Folsom's New England, 8 Montgomery street.
Little Giant, 3 Montgomery street.

Parties who have not had the opportunity to thoroughly examine the Florence at the Pavilion, owing to the crowd of people gathered around the machines, will please call at Sales Room 111 Montgomery street and test them at their leisure, and until perfectly satisfied whether what is claimed for them is true or not.

SAMUEL HILL,
General Agent for the Sale of the Florence on the Pacific Coast.

Tehama Trunk Manufactory.
JAMES LONGSHORE,
1df Cor. of California and Sansome streets.

IMPROVED CEMENT.—Common lime mortar becomes hard from long exposure to the atmosphere, by absorbing carbonic acid slowly, and thus returning to its original condition—limestone being a carbonate of lime. A patent has been taken out by C. W. Westmacott, of London, for a new cement to be used as mortar for building and plastering and also casting molds. The nature of the improvement consists of a mixture of carbonate of lime with common burned lime. The cement is composed of one hushel of burned lime to two bushels of ground dry chalk or ground limestone or marble. The lime, as it comes from the kiln, is first slacked with water, then mixed with the ground chalk or limestone in water; saud is then added in the same way that common mortar is made, and the mass allowed to stand for two or three days before the cement is used. This cement may also be made by mixing the burned lime, dry, with the chalk (which is dried in an oven) in powder, and kept for use, to be mixed with water. It may also be worked into a paste and molded like clay. It soon becomes quite hard and fixed.

ELECTRICAL PHENOMENA.—A party consisting of three men and a lady, with two guides, endeavored to make the ascent of the Alps on the 10th of July last, but when they had proceeded some distance they were prevented by a storm, during which they got into the middle of an electric cloud. Their hair emitted a hissing, crackling sound, as if it had been under the influence of a powerful electrical machine, and over their faces and bodies they experienced a prickling, burning sensation. Peals of thunder were heard, at each of which the party received an electric shock, but no lightning was seen. The right arm of one of the party was paralized for sevcral minutes; snow emitted hissing sounds; the lady's veil stood straight out, as also did the hair of all of them, which looked so ludicrous that they could not help hursting into laughter. The phenomena lasted for about twenty-five minutes, and no evil effects were felt by the party afterwards.

PRESERVATION OF FRUIT.—At the Russian Court fruit is preserved by being packed in creosotized lime. The lime is slacked in water in which a little creosote has been dissolved, and is allowed to fall to powder. The bottom of a plain deal box is covered with it one inch high, and over it is a sheet of paper. Upon this the fruit, well selected and cleansed, is arranged; over this another sheet of paper, and on top of this another such stratum of prepared lime; in the corners a little finely-powdered charcoal is put. The whole box is then filled in the same manner, and the well-fitting lid nailed down. Fruit kept in this manner will remain intact at least one year.

HAND MILLS—The Humboldt *Register*, in speaking of the miniature mills of Reese River says:—

"These hand mills are giving better satisfaction and larger returns than the steam mills. The working of ores by hand mills is quite common in many parts of South America, and it is said that large fortunes have been made with them there. Here is a chance for some of our energetic laborers. Let them try their luck with a hand quartz mill. Small quantities of rich rock can be easily obtained, and the result may be profitable. Money made in this way is worth just as much as if it were made in a forty stamp steam mill.

READY ROOFING

READY TO NAIL DOWN.

READY ROOFING
At less than half the cost of tin roofs.

READY ROOFING
More durable than Tin.

READY ROOFING
Suitable for steep or flat roofs.

READY ROOFING
For all kinds of buildings, in all climates.

READY ROOFING
Easily, cheaply, and quickly put on. Needs no coating over with cement after it is nailed down.

READY ROOFING
Made of a strong woven fabric, thoroughly saturated and covered upon both surfaces with a perfectly water-proof composition, and put up in rolls ready for use—40 inch wide, and 75 feet long.

WE ALSO MANUFACTURE
Liquid Cement,
FOR LEAKY TIN ROOFS.
Much cheaper and more durable than oil paint. Also,
Compound Cement,
For Leaky Shingle Roofs,
Which will often save the cost of a new roof.
Samples of Ready Roofing and Circulars sent by mail when desired. Favorable terms made with responsible parties who buy to sell again.
READY ROOFING CO.,

POSTPONEMENT.—The above sale is postponed until Saturday November 5th, 1864. 11

Putnam's Clothes Wringer.

IT IS THE ONLY RELIABLE SELF-ADJUSTING WRINGer. No wood-work to swell or split. No thumb-screws to get out of order. Warranted with or without cog-wheels. It took the FIRST PREMIUM at Fifty-Seven State and County Fairs in 1863, and is WITHOUT AN EXCEPTION the best Wringer ever made. Patented in the United States, England, Canada and Australia. Agents wanted in every town, and in all parts of the world. Energetic agents can make from three to ten dollars per day. Sample Wringer sent Express-paid on receipt of price. No. 2, $6.50. No. 1, $7.50. No. F. $8.50. No. A. $9.50. Manufactured and sold, wholesale and retail, by

THE PUTNAM MANUFACTURING CO.,

No 13 Pintt Street, New York, Cleveland, Ohio and Bennington, Vt. S. C. NORTHROP, Agent.

What Everybody Knows,

Viz: That Iron well galvanized WILL NOT RUST; That a simple machine is better than a complicated one; That a Wringer should be self-adjusting, durable and efficient; That Thumb-Screws and Fastenings cause delay and trouble to regulate and keep in order; That wood soaked in hot water will swell, shriuk and split; That wood bearings for the shaft to run in will wear out; That the Putnam Wringer, with or without cog-wheels, will not tear the clothes; That cog-wheel regulators are not essential; That the Putnam Wringer has ALL the advantages, and not one of the disadvantages above named; That all who have tested it, pronounce it the best Wringer ever made; That it will wring a Thread or a Bed-Quilt without alteration.

We might fill the paper with testimonials, but insert only a few to convince the skeptical, if such there be; and we say to all, TEST Putnam's Wringer. Test it THOROUGHLY with any and all others, and if not entirely satisfactory, return it.

Putnam Manufacturing Co:—

GENTLEMEN. I know from practical experience that iron well galvanized with zinc will not oxydize or rust one particle. The Putnam Wriager is as near perfect as possible, and I can cheerfully recommend it to be the best in use. Respectfully yours,
JNO. W. WHEELER, Cleveland, Ohio.

Many years experience in the galvanizing business enables me to endorse the above statements in all particulars.
New York, Jan., 1864. JNO. C. LEFFERTS.
No. 100 Beekman St.

We have tested Putnam's Clothes Wriuger by practical working, and know that it will do. It is cheap; it is simple; it requires no room, whether at work or at rest; a child can operate it. It does its duty thoroughly; it saves time and it saves wear and tear. We earnestly advise all who have much washing to do, with all intelligent persons who have any, to buy this Wringer. It will pay for itself in a year at most. HON. HORACE GREELEY.

Mining Notices.

Advertised in Previous Issues.

Aspinwall Gold and Silver Mining Company, Amador District, Lander County, N. T.

CAUTION.—The public are hereby cautioned against negotiating for the following described Certificates of Stock of the above named company, as the same were sold for delinquent assessments, on the 13th day of August 1864, and will not be transferred on the books of the company, to wit:

Certificates No. 80, 81, 82 and 83, standing in the name of B. T. Hunt. Certificates No. 71, 72, 73, 74, 75, 76 and 77, standing in the name of W. D. Mathenay.

11 JOSEPH HEALY, Secretary.

Buckeye and Old Hickory Consolidated Gold, Silver and Lead Mining Company—Locatiou, Santa Catalina Island, Los Angeles County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 3d day of September, 1864, an assessment (No. 7) of 50 cents per share was levied upon the capital stock of said Company, payable on the 10th day of September, 1864, in United States gold or silver coin, to the Secretary, at his office, No. 324 Clay street, San Francisco, or to J. K. PHILLIPS at the mine.

Any stock upon which said assessment shall remain unpaid on Saturday the 15th day of October, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold, on Thursday the 3d day of November, 1864, at 12 o'clock, to pay the delinquent assessment thereon, together with costs of advertising and the expenses of the sale. By order of the Board of Trustees.

B. C. AUSTIN, Secretary.

Office, 324 Clay street, San Francisco. 11-4

Crown Point Ravine Gold and Silver Mining Company, Gold Hill District, Storey County, Territory of Nevada; office, corner of Washington and Sansome streets San Francisco, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 23th day of September, 1864, an assessment of five dollars per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary at his office, or to JAS. B. COFFEY, Virginia City, Nevada Territory.

Any stock upon which said assessment shall remain unpaid on the 1st day of November, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on the 16th day of November, 1864, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

J. M. BUFFINGTON, Secretary.

Office, Rooms No. 8 & 10, Government House, corner of Sansome and Washington streets, San Francisco, Cal. [14

And in accordance with law and an order of the Board of Trustees, made on the 20th day of August, 1864, so many shares of each parcel of said stock as may be necessary, will be sold at the salesroom of Jerome Rice & Co., (now Maurice Dore & Co.) No. 327 Montgomery street, on the 8th day of October, 1864, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale.

E. J. PFEIFFER, Secretary.

Office, S. W. Corner Post and Dupont streets, San Francisco, Cal. 13

Dashing Wave Gold and Silver Mining Company.
Loomis Gold and Silver Mining Company.
Walker Gold and Silver Mining Company, Amador District, Lander County, Nevada Territory.

Notice is hereby given that at a meeting of the Board of Trustees of said Companies, held on the 23th day of September, 1864, an assessment of 25 cents per share was levied upon the capital stock of each of said Companies, payable on the 29th day of September, 1864, in United States coin, to the Secretary at his office, or to FRANCIS CLARK, Superintendent at the mine.

Any stock upon which said Assessment shall remain unpaid on Saturday, the 29th day of October, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Monday, the 14th day of November, 1864, at 12 o'clock M., to pay the delinquent assessment thereon, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

WM. HOLLIS, Secretary.

Office, No. 302 Montgomery street, San Francisco, California. 14

Daniel Webster Gold and Silver Mining Company, Sacramento District, Humboldt County, N. T.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 7th day of September, 1864, an assessment of thirty cents per share was levied upon the capital stock of said company, payable immediately, in United States Gold Coin, to the Secretary, at his office.

Any stock upon which said assessment shall remain unpaid on the 10th day of October, 1864, will be advertised on the 15th as delinquent, and unless payment shall be made before, will be sold on the 29th day of October, 1864, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

JOHN J. SCOTCHLER, Secretary

Office, 204 Front Street. San Francisco, Cal., Sept. 8, 1864
11-5t

El Dorado Gold and Silver Mining Company, Silver Mountain District, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 24th day of September, 1864, an assessment of fifty cents per share was levied upon the capital stock of said company, payable on the 25th day of September, 1864, in United States gold coin to the Secretary, or to S. A. HAWKINS, Superintendent, Silver Mountain.

Any stock upon which said assessment shall remain unpaid on Saturday, the 29th day of October, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 12th day of November, 1864, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

J. WARREN CLARK, Secretary.

No. 430 Montgomery street, San Francisco. 14-4t

Important to Californians.—Many inventors have lately had their claims for Patents seriously (and in some cases fatally) delayed by the unqualification of agents who have not complied with the Government license and revenue laws, as well as other new and imperative regulations. These discrepancies, although arising from the inexperience of honest agents, are none the less dangerous to applicants for patents, whose safest course is to trust their business with none but active and experienced solicitors. THE MINING AND SCIENTIFIC PRESS PATENT AGENCY has strictly complied with the requisitions of the Department, and properly filed all necessary papers as Claim Agents.

Good Hope Gold and Silver Mining Company, Alpine District, Alpine County.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 12th day of September, 1864, an Assessment of 25 cents per share was levied upon the Capital Stock of said Company, payable on the 3d day of October, 1864, in United States gold coin to the Secretary, at his office, or to H. MORRIS, in Markleeville.

Any stock upon which said Assessment shall remain unpaid on Saturday, the 15th day of October, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on the 29th day of October, 1864, to pay the delinquent Assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

PRESTON MORRIS, Secretary.

Office, No. 526 Montgomery street, San Francisco. [12-4t

M. of said day, to pay said delinquent Assessment thereon, together with costs of advertising and expenses of the sale, unless previously paid.

J. A. RAWSON, Secretary.

Office, No. 338 Montgomery street.

September, 30th 1864. 14-2t

POSTPONEMENT.—The above sale is hereby postponed until Thursday, the 20th day of October, 1864, at the same place and hour. By order of the Board of Trustees.

15 4 J. A. RAWSON, Secretary.

SALMON'S
PROPELLER AMALGAMATOR.

The proprietors and inventors of this machine, after fourteen years of practical experience in mining in California and Nevada Territory, and having a thorough knowledge of the wants of Miners and Mill men, have succeeded in making an Amalgamator, which, for the purposes intended, far surpasses any other yet presented to the public, and which can be furnished at less than one-half of the expense of any other Amalgamator, now in use, besides requiring less labor to clean and keep it in running order. The Amalgamator is simple in its construction, consisting of a pan of tub or box constructed of wood and adapted to either a Stone or Iron bottom. Opposite each other, and on the inside of the tub, are two flanges, from two to four inches broad, reaching from the top to near the bottom, with room for the mullers to pass under. These flanges are for the purpose of preventing the pulp from forming a circular current, and together with a number of wings placed like a screw-propeller on the muller-shaft, force a current continually on the quicksilver at the bottom and under the grinding surface of the mullers. This peculiarity of propeller-screw and side wings, in combination with a deep tub, are what the proprietors claim as new and for which a patent has been applied for. The inventors of this machine are practical Mechanics as well as experienced miners, and the machine offered by them to the public is the result of long experience and close observation. Manufactured at the San Francisco Foundry, San Francisco, Cal. by

J. & W. C. SALMON,

To whom all orders should be addressed. 15

TO QUARTZ MINERS.

Hinkle's Centrifugal Pulverizer and Amalgamator!

THE ATTENTION OF MINERS IS RESPECTFULLY requested to HINKLE'S CENTRIFUGAL PULVERIZER AND AMALGAMATOR, now manufactured and to be seen in operation at the NOVELTY IRON WORKS of Mr. E. F. Stech, Nos. 37 & 39 Fremont street, between Market and Mission streets.

This machine is the best in the State for the purpose of Pulverizing and Amalgamating ORES. The whole machine, made entirely of iron, will not exceed One Ton, and no piece of it will exceed 200 pounds, which makes it very convenient for transportation to remote districts. It will work Two Tons of Rock per day.

Mr. Hanson, who is running one of the machines, is an experienced Amalgamator, and will receive Ores at the above named place, and extract the metals and furnish assays for all persons wishing the same. The Subscriber is also perfecting a HAND MACHINE for Miners engaged in prospecting, which will work 25 pounds of ROCK at a time, and which will weigh about 125 pounds.

The Pulverizer and Amalgamator works Rock of the size of a grain of corn to an impalpable powder. Apply to

PHILIP HINKLE,

At the Novelty Iron Works, Nos. 37 & 39 Fremont street. 15-1m

Notice of Dividend.—Office Crescent Quartz Mining Company, Indian Valley, Plumas County, California, Sept. 20, 1864.

At a meeting of the Board of Trustees of the Crescent Quartz Mining Company, held this day, a Dividend of Fifty Dollars per share was duly declared, payable October 1st, 1864, at the office of I. OLAZIER & BROTHER, 311 Clay street, San Francisco, or at the office of the company, Indian Valley, Plumas county, California.

14w2 d-1 W. A. BOLINGER, Secretary.

Mining and Scientific Press Patent Agency.

SAN FRANCISCO.

Information About Obtaining Patents.

The Patent Law Amendment Act, of March 4th, 1861, and March 3d, 1863, now in force, introduces several important changes in our Patent System. The general practice of the Patent Office, however, in regard to the examination and issue of Letters Patent for new inventions, remains nearly the same as heretofore.

The amendment of 3d March, 1863, provides, in section 3, that every patent shall be dated as of a day not later than six months after the time at which it was passed and allowed, and notice thereof sent to the applicant or his agent. And if the final fee for such patent be not paid within the said six months, the patent shall be witheld, and the invention therein described shall become public property as against the applicant therefor: *Provided*, That in all cases where patents have been allowed previous to the passage of this act, the said six months shall be reckoned from the date of such passage.

The first question, therefore, that presents itself to the Inventor, who desires to procure a patent, is: "Can I obtain a patent?" A positive answer to this question is only to be had by presenting a formal application for a patent to the Government, embracing a petition, specification, model, duplicate, drawings, and the payment of the prescribed official fees. Aside from these steps, all the inventor can do is, to submit his plans to persons experienced in the business of obtaining patents, and solicit their opinion and advice. If the parties consulted are honorable men, the inventor may safely confide his ideas to them, and they will inform him whether or not his invention is probably patentable.

Those who have made inventions and desire to consult with us respecting the same, are cordially invited to do so. We shall be happy to see them in person at our office, or to advise them by mail, or through the MINING AND SCIENTIFIC PRESS. In all cases they may expect from us an honest opinion. For these consultations, opinion and advice, we make no charge. A pen-and-ink sketch, and description of the invention should be sent, together with a stamp for return postage. Write plain; do not use pencil or pale ink; be brief.

Remember that all business committed to our care, and all consultations, are kept by us secret, and strictly confidential.

Preliminary Examinations.

In some cases it may be advisable as a measure of prudence to order a preliminary examination. This consists of a special search made at the U. S. Patent Office, Washington, through the medium of our associate in that city, to ascertain whether among all the patents and models there stored, any invention can be found which is similar in character to that of the applicant. On the completion of this special search we send a written report to the party concerned, with suitable advice. Our charge for this service, including the report, is ten dollars. Though it involves the expense just named, will usually prove satisfactory. If the same device has been before patented, the time and expense of constructing models, preparing documents, etc., will in most cases be saved; if the invention has been in part patented, the applicant will be able to modify his claims and expectations accordingly. Many other obvious advantages attending the Preliminary Examination; although the strictest search does not always enable the applicant to know positively whether a patent can be had. Applications for patents are often rejected because the Examining officer finds a description of the alleged invention in some foreign publication; or some other person has been previously rejected on an analogous device; or some other invention for a similar purpose, but partially reversing the principle in its construction; or the Government makes an unjust or uncommon decision. Against none of these contingencies does the Preliminary Examination provide; it will, however, generally inform the applicant whether an improvement similar to his and used for the same purpose has ever been patented or not in this country.

Persons desiring the Preliminary examination are requested to remit the fee ($10), and furnish us with a sketch and description of the invention.

Caveats.

A Caveat is a confidential communication made to the Patent Office, and is therefore filed within its secret archives. The privilege secured under a caveat is, that it entitles the caveator to receive notice, for a period of six months, of any application for a patent subsequently filed, and which is adjudged to be novel, and is likely to interfere with the invention described in the caveat, and the caveator is then required to complete his application for a patent within three months from the date of said notice. Caveat papers should be very carefully prepared. Our fee for the service varies from $10 to $20. The Government fee under the new law is reduced to ten dollars; and this sum does not apply, as heretofore, as part of the fee on presenting an application for a patent.

Inventors will oftimes find it very important to take advantage of the caveat system—the expense under the law being comparatively small.

To enable us to prepare caveat paper, we only require a sketch and description of the invention; no model being necessary.

Expense of Applying for a Patent, Rejections, etc.

Under the new law, the Government fee, on filing an application for a patent, is fifteen dollars; and if the patent is allowed, twenty dollars additional is required. If rejected, the first fee of fifteen dollars is all that is demanded. English, French, Austrian, Prussian Spanish, and Inventors of every nationality, may now obtain patents in the United States upon the same terms as our own citizens. The only discrimination made is against subjects of governments that discriminate against the inhabitants of the United States.

To the foregoing official fees must be added the Attorney's fees for preparing the various documents and drawings. Our charge for preparing and presenting cases to the Government, and attending to all business connected with it, until a decision is given, is from $20 to $40. If the patent is granted no further agency expenses ensues. If the application is rejected we cause a thorough investigation to be made into the reasons adduced by the Examiners for refusing the patent. In making this examination, we have access to all the drawings, models, books and specifications cited in reference, and we report the result as early as possible to our client. For this service we make no charge. If the rejection proves to be an unjust one—which sometimes happens—it can generally be reversed, and the patent obtained by contesting the case. For this prosecution we charge a fee proportionate to the extra labor involved, payable only on the issue of the patent; but our demand will be reasonable and satisfactory to our clients, and will be arranged beforehand by special agreement.

The system adopted by us works well, gives general satisfaction and presents to all applicants, rich or poor, an equal opportunity of having their patent cases prepared, conducted and prosecuted in the best manner, by experienced attorney's, upon the most moderate terms. Inventors who have rejected cases, prepared either by themselves, or for them by other agents, and desire to ascertain their prospects of success by further efforts, are invited to avail themselves of our unequalled facilities in securing favorable results. We have been successful in securing Letters Patent in many cases of such a matter. Our terms for such cases are very moderate.

Models, Remittances, etc.

The law requires that the model shall, in all cases, furnish a model, which must not exceed twelve inches in any of its dimentions; it should be neatly made, of hard wood or metal, or both, varnished or painted; the name of the inventor should be engraved or painted on it conspicuously.

When the invention consists of an improvement on some known machine, a full working model of the whole will not be necessary. It should be sufficiently perfect, however, to show, with clearness, the nature and operation of the invention.

As soon as the model is ready, it should be carefully boxed and shipped by express or otherwise, to our address, namely: DEWEY & Co., Mining and Scientific Press, rooms 56 and 57, Government House, corner of Sansome and Washington Streets, San Francisco, Cal. Prepay expenses and send express receipt to us by mail.

Simultaneously with the model, the inventor should send us the first installment of the Government fee, fifteen dollars. The money may be forwarded either by express with the model, or by mail. The safest way to remit is by draft on San Francisco, payable to our order. Always send a letter with the model, and also the remittance stating the name and address of the sender.

A full description should also be sent with the model, embodying all the ideas of the inventor respecting the improvement.

On the receipt of the model and Government fee, the case is duly registered upon our books, and the application proceeded with as fast as possible. When the documents are ready we send them to the inventor by mail, for full examination, signature and affidavit, with a letter of instruction, etc. Our fee for preparing the case is then due and will be called for. The case will then be presented to the Patent Office, and as soon as the patent is ordered to be issued the Government fee, namely, twenty dollars.

Inventors who do business with us will be notified of the state of their application in the Patent Office, when it is possible for us to do so. We do not require the personal attendance of the inventor, unless it is one of great complication; the business can be well done by correspondence.

When the invention consists of a new article of manufacture, or a new composition, samples of the separate ingredients, sufficient to make the experiment, and also of the manufactured article itself must be furnished.

The average time required to procure a patent, when the case is conducted at our agency, is three months. We frequently get them through in less time; but in other cases, owing to delay on the part of officials, the period is sometimes extended to four or five months, and even more. We make a special point to forward our cases as rapidly as possible.

Return of Models.

Under the new law, if the applicant's case has been rejected he is entitled to withdraw his model from the Patent Office.

This law applies to all past rejected cases, and if parties wish to obtain their models through us, they can do so at a small expense.

Application for Patents, Designs, Trade-Marks, Labels, etc.

Under the new law patents may be taken out for any new form of any article, also for tools, patterns, castings, machine-frames, stove-plates, borders, fringes, all new designs for printing, weaving or stamping upon silks, calicoes, carpets, oil-cloth, prints, paper-hangings, and other articles. Trade-marks, labels, envelopes, boxes and bottles for goods, may also be patented; likewise all works of art, including prints, paintings, busts, statues, bas-relief, or compositions in alto, mezzo or basso relievo, new dies, impressions, ornaments to be placed upon any article of manufacture, architectural work, etc.

Our facilities for the prompt preparation and securing of patents are of the most thorough character and our charges are very moderate.

Patent Office Fees, and How Payable.

Nearly all the fees payable to the Patent Office are positively required by law to be paid in advance. For the sake of uniformity and convenience, these remaining fees will be required to be paid in the same manner; that is to say, before the labor is performed for which they are to be received in payment.

The following is the tariff of fees established by law:

On every application for a design, for 3 yrs and 6 mos	$10
On every application for a design, for seven years	15
On every application for a design, for fourteen years	30
On every caveat	10
On every application for a patent	15
On issuing each original patent	20
On filing a disclaimer	10
On every application for a re-issue	30
On every additional patent granted on a re-issue	30
On every application for an extension	50
On the grant of every extension	50
On appeal to the Commissioner from Examiners-in-chief	20
On every appeal to the Judges of Circuit Court, D. C.	25

Infringements.

The manufacture, sale, or use of a patented article, without consent of the owner of the patent, is an infringement, and subjects the infringer, by injunction from the Court, to an arrest of or prohibition from the employment of his machinery, shop, works, factory and men in production of the article.

In addition to injunction the infringer is liable to be mulcted in treble the amount of damages awarded by the jury. The maker, the workman, the seller, and the purchaser, if n user, are all liable either collectively or individually.

Having access to all the patents, models, public records, drawings and other documents pertaining to the Patent Office, we are prepared to make examinations and give opinions upon all infringement questions, advise as to the scope and ground covered by patents, and direct with vigor any legal proceedings therewith connected. Our charge will be moderate, and proportionate to the labor involved.

Appeals.

In rejected and other cases, the new law provides for an appeal from the Examiner-in-chief to the Commissioner in person, on the payment of a fee of twenty dollars. A further appeal may be taken from the decision of the Commissioner to the U. S. Court, of the District of Columbia. These appeals are heard by any of the Judges before whom the applicant elects to bring the case. No Jury. All the papers, models, etc., are sent by the Commissioner to the Judge, who then reviews the case, and either sustains or reverses the Commissioner's decision.

The party taking the appeal pays an additional fee of twenty-five dollars. The Judge appoints a day of hearing. The applicant can appear in person or by counsel to state his case and file a written argument. Five days are allowed the opponent to put in an answer, and a similar period to the appellant for a closing reply.

Many important cases are brought before the Judges on appeal and the decisions of the Commissioner are not unfrequently reversed.

We have had successful experience in conducting these appeals and our services are rendered on moderate terms.

DEWEY & CO., Agents,

Mining and Scientific Press Office, Government House, corner Sansome and Washington streets, San Francisco.

A MAGNIFICENT

LITHOGRAPHIC VIEW

OF THE

Mechanics' Fair Pavilion.

PUBLISHED AND SOLD BY

DEWEY & CO.,

GEORGE H. BAKER, Artist.

At the office of the "Mechanics' Fair Daily Press," entrance nave of the Pavilion, and at the office of the Mining and Scientific Press, corner of Washington & Sansome streets.

☞ *READ WHAT OTHERS SAY OF IT.* ☜

MECHANICS' FAIR PAVILION.—We have received from Dewey & Co., Patent Agents and publishers of the SCIENTIFIC PRESS, Government House, corner of Washington and Sansome streets, a finely executed lithographic view of the Mechanics' Industrial Fair Pavilion, on Union Square. The picture is mathematically correct in proportion, and will be valuable hereafter as a souvenir of the greatest industrial exhibition ever held in our city.—"Daily Alta."

We are indebted to the publishers of the MINING AND SCIENTIFIC PRESS for a copy of a very excellent engraving they have issued of the Fair building and the Fair grounds.—CALIFORNIAN.

LITHOGRAPHED.—The Mechanics' Fair building has been pictured in good style, by George H. Baker. We acknowledge the receipt of a copy. DEWEY & Co. are the publishers.—CALL.

VIEW OF THE MECHANICS' INSTITUTE PAVILION.—Messrs. Dewey & Co. have published a lithographic view of this building. Size, 12 by 19 inches. The workmanship does credit to Geo. H. Baker, the Lithographer. The dimensions of the Pavilion are 375 feet in length, breadth 220 feet; dome 108 feet high and 100 feet diameter, the area being 55,000 square feet. P. J. O'Connor Esq., is the Architect. We hope the sheet will prove highly remunerative.—ARGUS.

MINING COMPANIES and others connected with the Mining Interests of California, will find all possible desired information in the *Mining and Scientific Press* of San Francisco, which is an ably edited Journal, smartly handled, and well up to the times. The Mining Companies of California, are awake to the advantages of having their Mining Notices, comprising Assessments, Dividends, Elections, &c., concentrated in the advertising columns of one Journal, as we notice in the issue of the *Press* of May 7th, there are no less than seven pages of this interesting matter.—*U. S. Mining Journal, Railroad and Financial Advertiser, New York.*

NEW VOLUME.—The *Mining and Scientific Press*, published at San Francisco, has entered upon its fifth year of existence. It has been enlarged to a sixteen page paper, and is flourishing like a green bay tree. (We don't insinuate that it wicked.)—*Red Bluff Independent.*

AND SCIENTIFIC

Mining Press.

A Journal of Useful Arts, Science, and Mining and Mechanical Progress.

DEWEY & CO., PUBLISHERS And Patent Solicitors. | SAN FRANCISCO, SATURDAY, OCTOBER 15, 1864. | VOLUME IX. Number 16.

HANSCOM'S CRUSHER.

We herewith give two representations of Hascom's Rock Crusher. No. 1 represents a perspective view of the machine as it appears all ready for running. No 2 represents a sectional view of the same showing all its parts, which we will now endeavor to describe.

A is a moveable jaw; B is a die for the same; C is a fixed die; D D are two friction rollers, against which the moveable jaw works; E E are the supports for the rollers; F F are two wedges for adjusting the opening between the dies; G G is the frame of the machine; H is a toggle, by means of which and links not shown, the jaws are moved up and down; I is the shaft on which the toggle sits, and which is supported by links, not shown; K is a rod with a rubber spring for keeping the moveable jaw firm against the rollers.

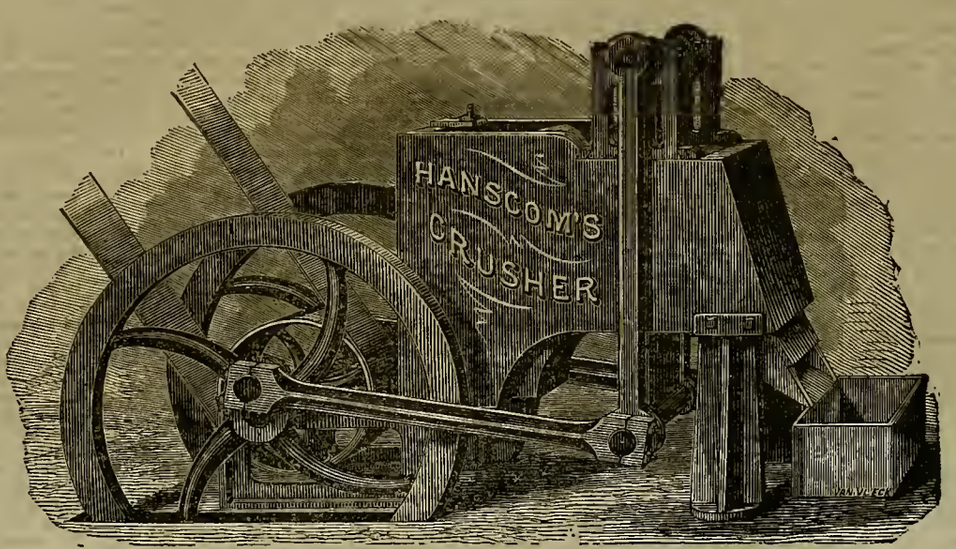

Fig. 1.

This machine is designed for breaking stone for macadamizing or for concrete; it can, in a few minutes be adjusted to crush rock fine enough for gravel or, if desired, even to dust, which renders it applicable to the reduction of quartz to such a degree of fineness as will allow of its being taken direct from this crusher to any of the grinding pans now in use. It is especially adapted to crushing copper ore, which it will readily bring to the proper size for concentration, without the intervention of stamps, which unavoidably produce much waste.

These machines are made of five sizes, from that which will take in a stone 2½ inches thick by 8 in length, to a size which will admit one of 7 by 18 inches; and reduce the same to any required size, from a diameter of two inches to fine dust. They are now in operation for making concrete, and giving the fullest satisfaction both in quantity and quality of work done. One of them is in daily operation at the Mechanics' Pavilion, where its work is the admiration of all beholders who are acquainted with this description of machinery. They are simple in construction, and not liable to get out of order, and the parts most subjected to wear are merely rough castings of iron, which can be easily replaced when they become non-effective from wear. Small sizes are made, weighing only 800 pounds, which will pulverize from two to three tons of quartz, every twenty-four hours, sufficiently fine for the arastra or grinding pan. This latter size is especially valuable for prospectors, or for taking into places difficult of access by wheels; for it can be taken to pieces so that the heaviest portion will not weigh over 250 pounds, in which condition it can be readily packed to any part of the mountains. A fine opportunity for examining the construction and working power of these machines is afforded, at the present time, at the Pavilion.

Another important advantage connected with this machine is the peculiarity of the motion which, to be understood, must be witnessed, with the sectional illustration given herewith to explain the peculiar construction of the jaws. It will be noticed, on close examination,

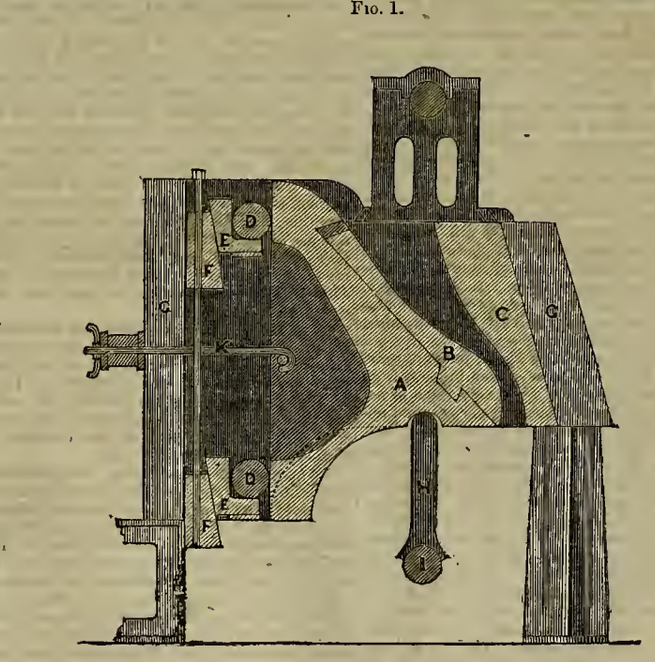

Fig. 2.

that in addition to the crushing power obtained, there is also an important trituration or grinding going on near the sudden curve in the lower portion of the jaws.

Any further information may be obtained by addressing Mr. W. W. Hanscom, Golden State Foundry, Nos. 19, 21 & 23 First street, San Francisco.

As you stand by your bride when you are married, so stand by her ever afterwards.

Roasting Ores.

It is generally admitted among miners that rich ores should be roasted as a part of the process of beneficiating. Why this is done, and what chemical changes are effected, we believe is not generally understood. The first lessons received by American miners in extracting the precious metals, were in the gold mines of California, and as such mining is the most simple of all, although that metal is the most royal, the knowledge gained availed naught when the science and skill for silver extraction were required. The essential difference between a gold and silver-bearing lode is, that the first metal is in a great measure mechanically associated with the vein rock, while silver is chemically combined with the lode carrying it. Such a difference exists between the rocks of California and Nevada. In the mines of Colorado Territory, we believe the gold is chemically combined with its matrix, as is the silver of Nevada. To work the gold rock of California it was only necessary to crush it as fine as the smallest particles of gold it contained, and give it an opportunity to settle in water and quicksilver. The process was so simple that it led to many quite disastrous errors in the working of silver ores. Since failures were made, much experimenting and study has been done, and now we believe that the silver ores of Nevada are worked as successfully as in any part of the world. One of chief features of working ores is the roasting. Silver is usually a combination of silicia, sulphur, arsenic, antimony, lead, copper, iron, etc. The ore is crushed to a very fine powder, and it is then mixed with from ten to fifteen per centum of common salt, which is also a chemical combination of chlorine and soda, and is then given over to roasting. This is concluded in a reverberatory furnace, which consists principally of a fireplace, hearth dome. The fireplace and hearth are on the same level, and upon the latter, about eight or ten feet square, is spread the charge of from six to seven hundred pounds. The hearth is separated from the fireplace by a partition called the bridge, rising to near the dome; the latter is an arch, covering all the others, and reflects, or reverberates the heat upon the ore on the hearth. The operation of roasting requires close attention and experience. The heat is first raised to oxidize the sulphides, and then increased to produce a reaction between the sulphurets [sulphates] thus formed and the chloride of sodium, producing chlorides of the various metals. In this operation the chloride of sodium, or salt, is decomposed by the sulphuric acids of the sulphates, and the chlorine set free, combining with the metals, while the soda of the salt combines with the sulphates [sulphuric acid] making sulphate of soda. When the operation of roasting is finished, which is done in five or six hours, the ore is removed, cooled, and taken to the amalgamating tubs.

The metallic chlorides are soluble in a strong, hot brine, and, consequently, the metals all soon become liquid. This matter, or pulp, is agitated for several hours by passing copper plates through it, and as the chlorine in the silver possesses a strong affinity for copper, it leaves the silver and joins the copper, allowing the silver to fall like fine snow upon the mercury placed at the bottom of the tub for its reception and retention, while the copper, dissolved by the chlorine, washes away with the other matter contained in the tub.

The operation is a beautiful one, almost purely chemical, the mechanical part, such as crushing and stirring, being only to assist the other. In Germany, where many of the conditions are different, iron, instead of copper, is used in precipitating, which precipitates all the base metals, and, for this country, seriously damaging the bullion.

Many have made the mistake that the native chlorine of silver, as found in our mines, is the same as that artificially produced, and that it may be worked as if roasted. This is a serious mistake. A body of pure native chlorine

is seldom found; it is generally more or less mixed with sulphur, and, although often worked successfully by means of chemical re-agents, such ores would undoubtedly pay much better if first reduced to a pure chloride. There are processes for amalgamating roasted ores that are said to be very successful, but the one used, of revolving copper plates, is generally adopted in this Territory.—*Reese River Reveille.*

The writer of the above article appears to be under the impression that the native chloride of silver, as found in the Reese River mines, could not be worked without previous roasting. For reasons which will be explained there is no doubt that the natural chlorides do not work well in tubs, such as are used at Reese River; but they will work very close to assay, within a few per cent, by an amalgamating pan. It is a well known fact, established by those working the Patio process, that natural chloride of silver does not dissolve as well in a salt brine as that formed in an artificial manner. This will be seen by consulting the papers on the Patio process, written by James Napier, and re-published in the Mining and Scientific Press of March, 1863. As the success of the process described in the article given above depends upon the solution of chloride of silver in a salt brine, the same difficulty will be experienced in dissolving the chloride of silver as in the Patio process. The pan, however, adding a *mechanical* to a chemical action, will not only decompose the chloride, by the influence of friction and iron, but it will also re-act upon the sulphide of silver and facilitate the amalgamation. We do not wish to be understood, however, to favor pan amalgamation for silver ores containing no gold.

A proper application of Augustin's process, where roasting has to be resorted to, will, no doubt, give a more economical result than any other process. The process described above could be simplified, and the machinery be done away with, without furnishing a poorer result. The writer of the above article believes, with many others, that the ores on this coast are worked as satisfactorily as they are abroad From the best information, however, which we can obtain, we are inclined to believe that the treatment or process for silver ores containing above a certain amount of arsenic, antimony and galena, is still a desideratum.

In explaining the re-actions which take place in a roasting furnace, in a chlorating roasting, the writer of the article in question speaks of "sulphurets" formed in roasting, meaning, no doubt, "sulphates." Again, the soda formed by a decomposition of salt does not combine with "sulphates," but with "sulphuric acid," formed by a contact of sulphurous acid with heated substances.

New Diggings.—By parties direct from Cañon City, in the John Day mines the Portland *Oregonian* is informed that new diggings have been struck on Rocky creek, a stream about eighty miles from Cañon City, on the Dalles road. Persons who were on their route to this valley were well pleased with the prospects they had obtained, and concluded to remain there. It was thought by some, however, that the hostility of the Indian tribes would not allow them to remain there long.

How Zinc should be Applied for Roofing.—A report of a committee appointed by the Central Society of Architects in Paris, recommends that zinc, which was at first rejected, but is now so generally used, should be applied with great care, as certain precautions, very simple, but never to be overlooked, are indispensable. Thus contact with plaster, which contains destructive salt, is to be avoided; also, contact with iron, which is very injurious, and liable to cause a rapid oxidation. Eave-gutters should always be supported by galvanized brackets, and no gutter or sheet zinc should be laid on oak boards.

Dr. Hazen, a chemist of Troy, has invented an improvement in the use of coal which it is said will diminish the consumption nearly, or quite, one-half. This will be the invention of the era, if realized. Several stove manufacturers have purchased the right, and are about introducing it into their business. The Central and other railroad companies are also about introducing it on their roads.

The lastest fashion in Washington, says one of the local papers, of asking a party to drink, is: "Please nominate your poison, gentlemen."

On Crucibles and Fire-Proof Material.

BY J. H. CHURCHILL, A. M.

The subject is of great importance to the owner of glassworks—the manufacturer of steel—the assayer of gold—the worker in brass, shareholders in gasworks, proprietors of veins of quartz, or of dry river bottoms, of lime kilns, of clay beds, of magnesia quarries, are all interested. Salt even contributes to the general result.

As one instance: A recent report to the Emperor of France estimates the difference of cost for fire-proof materials in making steel at thirty francs per ton between that country and England. Another, the cost of working up a quarter of a ton of platinum for the Russian government, was reduced five hundred fold by a process growing out of the work of M. Deville, by the use of lime cupels and gaseous fuel. My connection with the subject is this: In contriving some experiments on a subject cognate with that chemist's work on the alkaline metals, I had occasion, two years ago, to examine carefully the principles on which his results were founded. I have since followed many of them back into the hands of metallurgists who believed in alchemy. The best working authorities are, perhaps, Schlutter, Kirwan, Chaptal, Berthier, Haseufratz and Deville.

The materials used in making crucibles are, chemically speaking, silica, magnesia, alumina, lime, graphite. They occur in nature, and geologists know them, chiefly in combination, and deteriorated, as granites, gneiss, clay, slates, marl, quartz, plumbago, gas carbon.

Singly or in binary combinations they are very infusible—in ternary combinations with each other, or in presence of other matter, it is often otherwise.

Steatites, composed chiefly of silicate of magnesia, are more or less fusible in proportion to the quantity of alumina they contain. Lime, however, is not very refractory in contact with silica. A principle of general application, in the employment of fluxes, enables it to be made very useful. Calcareous sandstones are protected in iron furnaces by lime in the flux; excess of litharge preserves lime cupels from the action of glass of lead. Chemical affinity determines combination both within the crucible and with the materials of it, as in ordinary solutions with acids, yet bodies do not bear to one another the same affinities at different heats; thus, sodium is reduced by iron at a white heat, reduces oxide of iron at a red heat; is reduced by carbonic oxyd at a cherry-red heat, and reduces it at a dull red—the last fact we owe to Deville. The fusible monosilicate of iron penetrates clays at a moderate heat; while with more silex, at a white heat, and as used in quantity not exceeding eight per cent., it combines chemically with silicate of alumina forming a double salt, and in Potter's language, "a glaze." This is what occurs in the Staffordshire bricks, which, with one exception, the vitrified bricks of Wales, are, perhaps, those made at the highest heat, and are the least permeable; they are bluish in color.

The material of chief interest in brick is alumina, an element of epicene gender. It is now a base in clay, and again plays the part of acid in aluminate of lime. The first of these is nearly as old as the hills, and almost as varied in its properties; the last is a modern fabrication, and pretty definite, it will resist any heat short of that of fusion of platinum.

Alumina combines with silica in other proportions than those of clay. Stourbridge clay, which has at least the most refractory reputation will yield at a lower heat than alumina, with half an equivalent less of silex. Such a material was analyzed by Thomson many years ago, and it was said to have been brought from Chester, in Delaware. Clays vary much in nature, being soft and plastic in decomposed felspars, gritty in kaolin, hard in marl and slates these are fire-proof in proportion to the excess alumina. They vary in contraction, by drying, from one to fifteen per cent. The temperature for burning varies from ten degrees wedgwood in London bricks, to one hundred and twenty for Welsh bricks. Stourbridge and Staffordshire bricks are burnt at eighty-five and ninety-five degrees respectively. Prideaux speaks of crucibles almost entirely made of silex as very successful; great pressure was used in their manufacture. Gas carbon is recommended to be turned into shape. The fluxes to be used by the metallurgist, the alkalies of the glassworker, the opposite processes of reduction and scorification, the formation of chlorides at high temperatures, and the manufacture of cyanides, have such special action in each case that must be resisted, that, with variable materials, it is a tolerably obvious conclusion that they should have special applications. Fire-bricks and crucibles have a property belonging to them very available in this matter. I have mentioned the glazing properties of iron with silica in Staffordshire bricks; porcelain crucibles are glazed external; further, as we plaster our houses to suit the eye, we may line our crucibles and fire-bricks to suit our work—the crucibles may be thin—too thin or too fusible to support themselves at the highest temperatures—a lining may be then made to help them; gas carbon and lime have been thus applied by Deville—a lining may be made to absorb part of the flux or oxide, or will assist the purification of the melted metal; bone-dust and sand have long been thus used in cupeling the precious metals; lime is now thus used in preparing the most refractory—it may be difficult to cause a small percentage of metal to collect in one mass, the polished paste of aluminate of lime offers no impediment; charcoal permits an easy collection of the separate globules, and it also preserves the contents from the action of oxygen and of the carbonic acid generated by the fire; lutes applied externally, are also used for the latter purpose. In analysis, a platinum crucible, on the outside of one of porcelain, has been used to effect a better distribution of heat.

The permeability of crucibles varies much. The report quoted states that French steel manufacturers seldom use theirs for more than three pourings, on account of the increased porousness; with a charge which will yield 30 kilogrammes at the first pouring, they obtain only 27 at the second, and 24 at the third. Even density throughout is partly due to thorough vitrification, but is partly produced by mechanical means in the preparation of the clay. The "ring" which tells the thrifty housekeeper that there is no crack, tells the potter of uniform firing. The mechanical part of the result is obtained by reducing the materials to the same degree of fineness by grinding, puggiag and sifting. When this is not attended to, the uneven expansion in heating produces warping, and even partial cracking. This process is often carried so far that the clay can be suspended in water. At one factory on the Thames, a few years since, it was pumped and then floated on for a quarter of a mile. The finest stock bricks were made from this clay at a price of 25s. sterling per 1,000. Floating clay is, however, only common in making porcelain; in this condition iron is separated from it with magnets.

Fire proof pottery consists of pulverized material—burnt clay, plumbago, sand, or aluminate of lime, bound together by a plastic clay. The last, alone, contracts both on drying and in firing—the contraction commences afresh when it is exposed to a higher heat; hence the importance of selecting the burnt clay from such as has been fired at as high a temperature as the crucible is intended to stand, and of using as large a proportion of it as possible to avoid warping and cracking in the kiln. Thorough drying is of the utmost importance, to avoid hollows produced by escaping vapors. The application of great pressure in moulding has enabled some manufacturers successfully to reduce the amount of the plastic unburnt clay. A most refractory brick has been made in this way containing ninety-five per cent. silicious matter. Deville prepares aluminate of lime by fritting together chalk and alumina. The cost of the last he estimates at about $3 per cwt. Gas carbon the same chemist purifies by treating it at a high heat with chlorine. Besides the use of aluminate of lime to mix with alumina to form the body of refractory ware, he also applies it as a lining. He makes a paste of four parts calcined alumina, and one part of aluminate of lime, well powdered and sifted, he quickly lays this on inside a clay crucible, spreads with a piece of ware, and compresses it firmly till perfectly polished, dries it and heats it to redness; this varnish protected the silica of the clay crucible from the alumina and fluor on which he had to operate.

Other successful improvements in brickmaking are drying by the heat from a cooling kiln, grinding marls, and rolling in lieu of pugging; these are applicable to the manufacture. That of most promise in use will probably be melting with gas, applied directly to the metal inside, with or without fuel on the outside. I am interested in perfecting this.

The paper was accompanied by specimens of crucibles of various makes, of one of curved outline to avoid any angle or change of thickness near the bottom, designed by the writer, and constructed for him at Greenpoint, N. Y., and also by diagrams of Deville's apparatus for cupelling with gas. Specimens of alumina, and of clay calcined, to show the change of color in proportion to the iron present; and of bricks acted on by silicate of iron, were also shown, as also both amorphous and crystallized quartz penetrated by iron at the heat of a coke fire, without blast.

A formidable mosquito raid occurred in Newark, New Jersey, recently, to the dismay of the inhabitants. The raiders penetrated chambers, stores, and country houses, and in many stores they were so numerous that the proprietors closed them, as customers were deterred, by the singing noise, from entering.

Bullion from Reese River.—Wells, Fargo & Co. shipped from Reese River, during the month of September, bullion, to the amount of $54,504 in value.

Combination of Coal Miners.—A gentleman who has just returned from an extended tour through Illinois, Ohio and Pennsylvania, says the miners throughout the whole of the vast coal regions are combined and organized under the style and title of "The American Miners' Association." The leader and prime mover of the whole is a lawyer of more than ordinary ability, whose eloquence fits him for moving, by his appeals to their passions, large masses of the neighboring population. This lawyer is editor of the organ of the Miners' Association, *The Weekly Miner*, published in Belleville, Illinois. The Miners' Association will hold its annual convention in Cincinnati on the 7th of September, each lodge throughout the mining regions sending delegates in proportion to the number of its members. There will be present in that convention from five to six hundred delegates. What will be the result I know not. It is a combination of workingmen of vaster proportions than ever before attained, with acknowledged ability at its head.—*Pittsburgh Chronicle, August 30th.*

Soldiers' Vote.—The Supreme Court, that is a majority of the members of that body, has affirmed its decision that the law allowing the soldiers to vote is unconstitutional. It will be recollected that under the law of 1863 California soldiers voted for State and county officers. In Tuolumne county the Union candidates for county officers were elected with the soldiers' vote; without it they were defeated. The vote was contested, and the Supreme Court, full bench concurring, declared it unconstitutional. A motion was made and granted for a rehearing. After argument on rehearing the Court reaffirmed its first decision—Chief Justice Sanderson and Justice Curry dissenting. The decision was given on Monday.

During the great European wars that followed the French revolution, and especially during the Napoleonic period, and for several years subsequent to Napoleon's overthrow at Waterloo, the finances of England were in a deplorable state. The Bank of England suspended specie payments for a period exceeding twenty years; and the merchants and people of Great Britain saw worse times than we have ever dreamed of in this country. Should there be another great European war, as many statesmen think there soon will be, in which England will be compelled to take a part, that Government will reap a terrible reward for the unfriendly course it has pursued toward this country.

The Late Belfast Riots.—The recent terrible riots in Belfast, Ireland, were, as usual, caused by the Orangemen. A grand demonstration was made by the Irish people on the occasion of laying the foundation stone of the O'Connell monument in Dublin; and the Orange lovers of English usurpation and haters of their country got up what they were pleased to call a "counter demonstration." They beat and murdered innocent people, and wrecked houses in a most miscellaneous manner. During the riots the streets of Belfast were filled with English troops and constabulary, but whether for the purpose of restoring order or participating in the "demonstration" does not appear quite clear, as the disturbances lasted several days. Quite a number of the populace were killed.

An exchange furnishes the following plan by which underground operations can be ascertained on any near approach: "Drive an iron gun-rod into the ground, near where it is supposed a mine is being made, until it is firm in the ground. Take it then between the teeth and close the lips tight around the rod, then close both ears with the fore-fingers and listen. You can hear a great distance underground in this way."

Bullion from Gold Hill.—The *News* says: Wells, Fargo & Co. have shipped from their office in this town, within ninety days, up to October 1st, in bullion, the sang little sum of *three hundred and sixty-five thousand five hundred and ninety dollars.* This, however, was not the only product of our Gold Hill mines, there being a large amount of bullion assayed and shipped from Virginia. The Gold Hill mines have never been more productive than they are now.

To Remove Pain.—Dr. Hall says, neuralgia of severest character is sometimes removed by painting the parts two or three times a day with a mixture composed of half an ounce of the tincture of iodine and half a drachm of the sulphate of morphine. One of the most powerful liniments for the relief of severe pain is made of equal quantities of spirits of hartshorn, sweet oil and chloroform; dip into this a piece of cotton cloth doubled, about the size of a silver dollar, lay it on the spot, hold a handkerchief over the spot, so as to confine the fumes, and the pain immediately ceases. Do not let it remain on over a minute. Shake it well just before using, and keep the bottle very closely stopped.

PROGRESS OF THE GEOLOGICAL SURVEY OF CALIFORNIA.

Professor Whitney, who is now in New York, superintending the publication of the first volume of the Geological Report of California, has communicated to the *American Journal of Science*, for September, an interesting statement of the progress of the survey, one or two items of which we noticed in our issue of the 1st inst. After briefly noticing the recent financial action of the State with regard to the object of his labors, he proceeds to say that the first volume to be issued will comprise the first instalment of the Paleontology of the State, and will be illustrated by thirty-two plates on steel and stone, which are now in the hands of the engravers, while the accompanying text is already passing through the press. The contents of this volume were given in our issue of the 1st instant.

The second volume will go to press immediately after the appearance of the first, and will be devoted to the general geology of California. It will be issued in the early part of 1865. In the third volume it is proposed, though not definitely determined, to commence with the zoological history of the State.

The pages before us proceed to give a sketch of some of the principal results of the survey, up to the present time, in the following order:

TOPOGRAPHY.

The progress of the work in this department has been frequently alluded to in the columns of the PRESS. A very interesting notice of what has been done during the past season, in the High Sierra near the head waters of Kern river, was given in our last issue. Some additional facts under this head, taken from the sketch before us, are given below in the Professor's own language:—

One of the most interesting facts observed here, for the first time in the Sierra, was the proof everywhere surrounding us of the former existence of glaciers, on an immense scale of magnitude. All the phenomena of former glacier action are exhibited to the greatest advantage in the upper Tuolumne valley, through which once flowed a mass of ice nearly 1000 feet in thickness. Thousands of acres of granite retain the most exquisite glacial polish, and the existence of lateral, medial, and terminal moraines is as easily observed as in the Alps at the present day.

These traces of extinct glacier action were afterward discovered by us in many other places to the north of this, through to Mt. Shasta. * * * * * * * * * * *

It is uncertain, as yet, how aad in what form our topographical work will he laid before the public, except that the publication of the maps of the vicinity of the Bay of San Francisco and of the Monte Diablo region has been determined on, and they will be soon placed in the engravers' haads. It is believed, however, that such arrangements will be made as shall ensure the publication of a map of the entire State, greatly improved on anything which has yet appeared, and as large as can be conveniently used for a wall-map—say, on a scale of twelve miles to the inch. A map of the central portion of the State, on a scale of about six miles to the inch, embracing the principal mining regions, and covering the area occupied by at least four-fifths of the population of the State, will also probably form a part of the materials prepared for publication by the Survey.

PHYSICAL GEOGRAPHY.

Observations in this department have been steadily carried on during the progress of the Survey, and one of the volumes of the report will be devoted to this department of our work. Allusion may be made here to the very important investigations which have been carried on in California, for some years past, by Major R. S. Williamson, U. S. Engineers, on the laws governing the fluctuations of the barometer on the Pacific Coast. These investigations, for which small amounts have been appropriated by the Topographical Bureau, and which have been prosecuted by Major Williamson with the greatest zeal, will, when their results are published, be of material aid to the Geological Survey, and we shall be able to use them in the final working up of our own very numerous hypsometrical observations. The data collected in the course of these investigations have been employed by Major Williamson in working up the observations taken by the U. S. and California Boundary Commission in 1861, in and near Death's Valley, enabling him to fully confirm and give a scientific basis to the idea previously vaguely entertained, that this remarkable valley, which is 180 miles from the Pacific and which may be compared to that of the Dead Sea of Palestine, is indeed considerably depressed below the level of the ocean.

GEOLOGY.

Up to the present time, and including this season of field-work, we may be said to have been chiefly engaged in making a general geological reconnoissance of the State, and we have travelled very extensively over it, in all directions. But considerable areas remain, for various reasons, yet unexplored. The northwestern counties have remained inaccessible on account of Indian troubles; and portions of the southeastern for the same reason—with the additional one, that the drought has seriously interfered, for the last two years, with operations in that quarter.

In addition to work carried on within the boundaries of California, we have considerably extended the area of our field of labor by observations made in the adjacent territories, and not considered, or paid for, by the State as part of the regular work of the Survey. * * * Mr. Rémond has been for some time in Sonora, Mexico, and has made interesting discoveries, which will enable us to prove the continuance of the geological formations of California far to the south, and which connect with our line of observation, so as to form a chain—broken at many points, it is true—of about 2000 miles in length. * * * * * *

On the whole, it may be said that the labors of the past three, and of the coming four years, can hardly fail to furnish us with the means of giving a tolerable approximation to a geological map of the Pacific coast of our continent, and one, it may be added, which will have little resemblance to those which have heretofore been published. For anything like a detailed knowledge of the whole of this vast, mountainous, and extremely difficult region, we shall have to wait many years.

In alluding to a few of the results of the Geological Survey in this department, it will be necessary to be extremely brief; for, even if this were a suitable place for it, details would hardly be intelligible without maps and sections.

Perhaps the most striking result of the Survey is the proof we have obtained of the immense development, on the Pacific side of our continent, of rocks equivalent in age to the Upper Trias of the Alps, and paleontologically closely allied to the limestone of Hallstadt and Aussee, and the St. Cassian beds, that extremely important and highly fossiliferous division of the Alpiae Trias.

This great Triassic belt of the Pacific coast has been most fully explored by the Survey in the latitude of 40°, and over a width east and west of nearly four degrees of longitude (117° to 121°). It is from this region that the largest portion of the fossils have been obtained, both from the three parallel ranges in long. 117 to 118°, called the Humboldt ranges, and from localities in Plumas county, California. But sufficient paleontological evidence has been obtained to enable us to state that this formation extends from Mexico to British Columbia, occupying a vast area, although much broken up, interrupted, and covered by volcanic and eruptive rocks, and usually highly metamorphosed.

Among the specimens from Humboldt and Plumas counties, Mr. Gabb recognizes at least four species as identical with European, while the whole facies of the collection is most strikingly like that of the Hallstadt beds—the same intermixture of the orthoceratites, ceratites, goniatites, nautili and ammonites, the latter frequently of those peculiar globose forms occurring in the Alps, together with *Halobia, Monotis, Aviculа, Pecten*, &c., a *Monotis*, being the most widely diffused and the most abundant of all.

Accompanying this Triassic formation in the Sierra Nevada, and probably also in the Humboldt ranges, is an extensive development of Jurassic rocks, usually highly metamorphosed and extremely barren of fossils. Enough, however, have been found to justify the assertion that the sedimentary portion of the great metalliferous belt of the Pacific coast of North America is chiefly made up of rocks of Jurassic and Triassic age, with a comparatively small development of carboniferous limestone, and that these two formations are so folded together, broken up, and metamorphosed in the great chain of the Sierra Nevada, that it will be an immense labor, if indeed possible at all, to unravel its detailed structure. While we are fully justified in saying that a *large portion of the auriferous rocks of California consist of metamorphic Triassic and Jurassic strata*, we have not a particle of evidence to uphold the theory that has been so often maintained, that all, or even a portion, of the auriferous slates are older than the carboniferous; not a trace of a Devonian or Silurian fossil even, having been discovered in California, or indeed anywhere to the west of the 116th meridian. On the other hand, we are able to state, referring to the theory of the occurrence of gold being chiefly limited to Silurian rocks, that this metal occurs in no inconsiderable quantity in metamorphic rocks belonging as high up in the series as the cretaceous.

Allusion has already been made to the widespread occurrence in California of the cretaceous formation. The coast ranges of California and Oregon, indeed, are to a large extent made up of rocks of this age, usually more or less metamorphic in their condition, and frequently highly so; but still, on the whole, forming the richest fossiliferous formation of the State, having already yielded fossils at over thirty localities. * * *

Coal Oil vs. Coal for Fuel.

Much has recently been said with regard to the economy of the use of coal oil, instead of coal for fuel in generating steam. The following article upon this subject, which we find in the *American Gas Light Journal*, will doubtless be read with considerable interest by all who are interested in this discussion:

SIR: I desire to answer some observations made through the press generally, unfavorable to the employment of Petroleum or coal oils for the generation of steam, which observations were based upon the calculated effect of coal and petroleum.

In answer to which I would state, that the heating value of coal, in practice, cannot be rated from the resultent of a few particles in a chemical experiment; (as is admitted by all competent engineers.) It is for this reason that many things good in principle are not good in practice.

The heating value of 100 pounds of coal, average quality, specific gravity 1.279, is equivalent to raising 812,307 pounds of water 1., centigrade. The heating value of 100 pounds of Petroleum is equivalent to raising 1,231,600 pounds of water 1., centigrade, making the heating value of coal as compared with Petroleum as 1 is to 1.51. This is the calculated value of their component parts. But these comparative results cannot be carried out in practice, by reason of the necessarily imperfect method of burning coal.

It is true, great and successful improvements have been made in the combustion of solid fuels, from the time of its introduction; but coal cannot be perfectly consumed, unless first converted into gas, as explained hereafter. Some of the solid fuels may be perfectly consumed by the admixture of pure oxygen at the time of consuming. But inasmuch as the oxygen has to be obtained from air, in practice, and is therefore largely diluted with nitrogen, I shall speak of it hereafter in contradistinction to pure oxygen as air.

Air is equivalent to pure oxygen for the purpose of obtaining perfect combustion, only when the material to be consumed is in the shape of gas, and mixed with air in the proper proportion, prior to their union by combustion. The result of such a union with any of the hydrocarbons, would be the same as in pure oxygen, (i e., water and carbonic acid gas, exceptiag the nitrogen set free in the employment of air.)

The difference between consuming hydrocarbon fluids in the open air, as from a pan or plate, as compared with consuming the same from a vapor or gaseous state, (where it receives its admixture of air prior to consuming,) is as one for the former to three for the latter in the amount of heat evolved.

In the employment of bituminous coals for furnaces, there is about the same per centage of loss, save where the carbonic oxyd is made use of for generating steam.

There is, without doubt, an average loss of 50 per cent. of the effective heating qualities of bituminous coals, in the present mode of consuming the same, which, unfortunately, there is but limited help for; as the only perfect way of consuming the same, is to convert the coal into gas, which the coal is naturally adverse to, and requires the extra employment of fuel for the conversion of the same, aside from the difficulties of a cumbersome and expensive apparatus, which will always prevent that method being adopted.

This is the point where one of the great differences between the employment of oil and coal exhibits itself in favor of the oil.

The oil is readily converted into vapor or gas, which enables the proper admixture of air, (for the perfect combustion of oil,) prior to consuming the same.

Fuel is valuable in proportion to the amount of oxygen it will consume. Viewing it in this light, the most effective fuel is found in coal oil, i. e., that which is procured from coal by destructive distillation. The introduction of which oil was the cause of my making a series of experiments to discover the proper mode of burning the same, prior to the commercial discovery of the Well Oil (Petroleum.)

Within a few years, coal oil sold, and was delivered in Philadelphia, for 10 and 12 cents per gallon, in small quantities, at which time an amount to supply any demand could have been procured at the above and lower rates, as coal oil works at that time were in operation, and would have only been necessary to increase their works.

The introduction of Petroleum crowded out the coal oil, and left it without a market, by reason of the superior qualities of Petroleum, it being superior in every respect, except for heating purposes.

Many of the coal oil works that were not convenient for the re-distillation of Petroleum, were left to stand idle, or sold for the old iron which they contained.

Petroleum stands convicted of retarding the progress of the manufacture of coal oils, by giving a much better substitute (for lighting and lubricating purposes.) But there is a sphere for both—the one can furnish light, and the other heat.

The first will illuminate our path, the second will give us power,—both will give us mineral wealth equivalent to any other product.

The superior quality of Petroleum, combined with the tariff provided by Congress, together with tariff Congress did not have to provide for, i. e., the exchange, has caused the price of Petroleum to advance too far for the purpose of a fuel; whereas, coal oil could be sold at the same price now, or at a very little advance over what it did sell for when in full operation.

Improvements in the manufacture of oils would more than compensate for any extra cost at this day. All that is necessary is, for capitalists so see that there is about to be, and will be, a great market for this species of fuel, when capital will seek investments for the supplying of liquid fuel, the same as they now supply solid fuel. There are thousands of acres of cannel coal, and deposits of bitumen, not inconvenient to any seaport, when transported in the shape of oil. Material that furnishes this liquid hydrocarbon is being found throughout the world where commerce reaches. It can be supplied at any seaport with less inconvenience than coal.

The portable character of the oil will be the means of a large saving in point of handling, as compared with other fuels; as, for instance, a tank, situated on a wharf, for the purpose of loading vessels with fuel, would only require the simple appendage of a hose for leading the oil into a tank of water-tight compartment in the vessel, which could take its load of fuel as readily as a locomotive takes its supply of water along the road. The oil unloads itself from the tank, without the intervention of forty or fifty men for handling the same, as in coal; to say nothing of the delay to the steamer, and the accompanying dirt and dust.

It is supposed the oil is dangerous, as it is easily ignited; whereas, it is safer than coal, as the oil is conveyed in iron tanks, and cannot, therefore, be ignited until drawn therefrom, which operation is performed by a pump, and removes the oil in proper quantities from the tanks to the fire-box, where it is consumed and controlled at will.

In case of a collapse of a flue, or internal leak in the boiler, the liability of firing the vessel is very great, as the steam, in blowing through the furnace, carries the fire with it, setting the neighboring portions of wood on fire, and causing the men to leave their post.

The oil would be provided for as an emergency of this kind, as the supply could be immediately cut off, which would extinguish the fire in one minute; whereas, it is a matter of from one to two hours to extinguish a coal fire under a large furnace. As a fuel, the oil is superior to coal, in every respect, upon the ocean.

NEW AND INGENIOUS APPARATUS.—A most ingenious apparatus has been contrived for exhibiting the muscular mechanism of the human eye, and is called the "automatic eyeball." It was sent by the inventor, Professor Hasner, of Prague, to the Austrian Court of the International Exhibition at London, and at the close of the latter was presented to the Royal London Ophthalmic Hospital. The apparatus consists technically of a *left* eyeball, the movements of which are regulated by springs attached to keys, which are worked like the keys of a piano-forte. There is also a graduated dial attached, upon which, by means of indexes affixed to and moving with the strings, the extent of each muscular action is accurately marked. This simple contrivance thus exhibits at a glance the beautiful arrangement of the muscular structure of the eye, the knowledge of which could hitherto only be acquired by dissection or oral instruction. In short, the "automatic eyeball" performs for the exterior what the ophthalmoscope has already done for the interior of the eye.

MINERAL RESOURCES OF FRANCE.—From recent statistical returns of the mineral riches of France it appears that the number of coal mines worked is 490, and of iron mines 202. Of other substances there are 247 mines, comprising graphite, bitumen, rocksalt, antimony, manganese, lead, silver, copper, tin, and zinc, isolated or in combination. The concessions of coal mines extend over 5,236 square kilometres (each 247 acres), in 47 different departments. The mines of ironstone embrace an area of 1,243 square kilometres, and lie in 31 departments.

City Stock Reports---San Francisco Stock and Exchange Board.

From the "Weekly Stock Circular" of the Associated Brokers.

San Francisco, Saturday Morning, Oct. 15th, 1864.

Leading mining shares have obtained decided favor this week and materially advaneed; attributable for the most part to recent developments, and a returning confidence in the permaneney of a number of claims on the Comstock. It is now believed by some, that the disfavor in which these stocks were held a short time since, was not based upon intelligent or reasonable conclusions, and that their actual condition then, was much more promising than was generally supposed. Influential parties, it is said, were also enlisted to give an undue coloring to any unfavorable feature that might present itself and many stockholders and dealers have acted upon information received through these channels and now find that they were misled and have been induced to part with their stock at a ruinous sacrifice. On the other hand it is asserted by those who pretend to be best informed in the premises, that there were good and substantial reasons for the late panic, and that the present advance would not have been realized but for the favorable disclosures made withiu the past few weeks. We present these theories for what they are worth.

Orders have been received this past week from the East to buy some of the more prominent shares at current quotations, and it is evident that our stock market is again engaging the attention of New York parties and will doubtless be favorably influenced by purchases for their account.

The receipts of treasure from the mining districts, since the 1st inst., exceed $2,000,000 and the product of the entire coast for the first nine months of the current year, amounted to some $43,000,000, including about $11,500,000 from Nevada Territory. These figures show an increase of $3,000,000 as against a corresponding period of last year, notwithstanding the drought, which has so seriously affected the placer mining interests of this State.

The money market is growing easier and capitalists are more eager to loan upon the better class of mining stocks at 1½ per cent per month.

Gould & Curry has been dealt in to the extent of 72 feet, opening at $1340, reeeding to $1300, seller 30, then steadily advancing to $1850, declining to $1750, sellers option 30 days, and closing last evening at $1,675. The late rise is a subject of much eomment in stock eircles, and we regret our inability to state authoritatively upon what it is predieated. It is, however, believed to be owing to the discovery of a body of good ore in the lower portion of the miuo. A number of dealers are doubtless well posted but others complain that reliable information cauuot he obtained. It is stated that at a depth of 100 feet below the lower level, the engine shaft has disclosed a vein of fair milling ore ahout 15 feet wide, whieh continues to improve as work progresses. This deposit is near the line of the Savago company, and present indications are thought to be flattering.

Savage has been inaetive hut in much request and rose from $1,750 to $1,950, elosing at $1,850 bid and $1,925 asked. Developments in this mine have been of the most favorable charaeter lately, and the yield of hullion for the eurrent mouth may justify a further increase in dividends to the stoekholders. A shipment of first elass ore valued at $25,000 was made to England per last steamer.

Chollar is well maintained, and 19 feet have been sold at from $870 to $890. The south mine is said to look as well as it formerly did, and the drift on the eastern faee of the vein is to he eontinued until the end of the lode is reuehed. Receipts of bullion for the month of Oetober will, it is thought, nearly extinguish the indebtedness of the company, and enable the management to aeeumulate a fund for the dividend aeeouut.

Potosi fell from $790 to $760, rose to $800, and elosed at $825 asked. The argument in the suit of this eompauy *vs.* the Bajazet is now being made before the referee. Operations in the main shaft of this mine are progressing vigorously.

Yellow Jaeket is attracting more attention, and 32 feet were sold, advaneing from $650 to $780, and receding to $720 and $750. A vein of good pay ore has been developed, which is giving employment to a number of mills, and the prospects of the company are deemed hetter thau they have heen for some time past.

Ophir has been quite a feature of the market this week, and 140 feet have ehanged hands, advaneing from $350 to $365, reeeding to $350, then quickly rallying to $475@485, and selling yesterday morning at $480 and at the afternoon Board at $470. The eompany have lately taken some 1,500 tons of third-elass ore from the fourth, fifth and sixth stations in the south mine, and the new mill is to be employed at ouee in the reduction of the large amount of this quality now on hand, estimated at 5,000 tons. In the seventh gallery, some good oro has heen fouud.

Uncle Sam is in better favor, and some sales were made at $265@360, and $350 is now bid—$375 asked. Ten shares of Overman were sold at $135 and ten at $170@200.

Hale & Noreross advanced from $350 to $500, and is now held at $475. A large body of water still interferes with the progress of the different drifts from the lower levels.

Belcher was sold yesterday at $650, and for Crown Point $500 was hid. Best & Belcher is held at $200, and $125 is bid.

Imperial has heen aetive, and 184 shares were dealt in at $145 to $148, closing at $149. There is no abatement in the regular supply of hullion from the company's elaims.

Sheba is firmer, and has risen from $67½ to $75, with sales of 33 feet. The mill is constantly at work upon oro averaging some $150 per ton, but thus far not more thau six tons per day can be successfully treated.

Burning Moscow still maintains a prominent position in the market, and 1,647 shares have heen sold, opening at $45, advaneing to $57, buyer 30, declining to $49, again rising to $62, buyer 30—selling yesterday afternoou at $59.

Wide West rose from $26 to $30, and closes at about $28. 245 shares were sold within this range. Lady Bryan deelined from $7½ to $6, and 256 shares changed hands. Bullion rose yesterday from $62 to $80; Pride of the West sold at $6@5½; Green (G. H.) at $5@5½; and Blue Ledge at $2.

Nevada (J. G.) rose from $38 to $45, fell to $38 and elosed at $40. 113 shares were sold. Baltic was sold at $28@30. North Amerieau rose from $45 to $55; and 23½ shares of Midas were sold at $200 per foot.

Antelope changed hands at $19½@21; Real del Monte at $25@24½; Golden Age and Empire, $17@18; and De Soto at $18.

Buekeye fell from $13 to $8. Sixty tons of ore erushed at Brigg's mill yielded $51, aud 40 tons at the same mill produced $56.

The aggregate sales of stock, since Saturday last, amounts to $375,435.50.

Anything above $3,000 per foot, three-quarters of one per cent. on the amount of purchase or sale.

FRANK LAWTON, Secretary.

J. B. E. CAVALLIER, President.

Mining Summary.

CALIFORNIA.

NEVADA.—The Nevada *Gazette* says that from present indications, instead of being "played out," the mines of wealth hidden in the hills of Nevada county are just beginning to be developed. Rich strikes are being made in old diggings, new ledges discovered, prospectors are out in every direction, and when the rains come we may confidently anticipate a return of the old-time prosperity.

Thirty-one tons of rock from the General Grant ledge, recently crushed at the French mill, cleaned up $28 per ton. Eighteen and a-half tons from another ledge on Little Deer creek yielded $37 per ton.

Sharp, Smith & Co. last week cleaned up from sixty tons of rock from the Union ledge, $6,600. They are confident their next crushing will yield at least $125 per ton.

Sigler, Gow & Co., of the Eureka ledge, on Little Deer creek, have cleaned up from their first crushing, the rock yielding at the rate of $35 per ton—sufficient to pay all the expenses and leave a dividend to the company. Their ledge is well defined, and promises to prove very rich.

Owing to the scarcity of water and the large amount of rock they have to crush, the proprietors of the French mill have found it necessary to put up a steam mill, and will hereafter run their works night and day.

The *Gazette* learns that a company of San Francisco and Nevada capitalists are about completing arrangements for running a tunnel from Little Deer creek to the center of the ridge. It will be several thousand feet in length, and will be driven so as not to interfere with the work on the ledges which it may cross.

ALPINE COUNTY.—The Manchester Company are preparing in good earnest to drive their works this winter to some purpose. A steam engine has been ordered from below, which will soon be on its way to assume a stationary position near the shaft.

The Winchester Company held their annual meeting on the 24th ult. The Trustees' report, presented at the meeting, shows that three assessments, amounting to 45 cents on each share, have been levied and collected, resulting in the aggregate of $2,250. Disbursements have been made as follows: Labor, $1,919.57; tools, powder and fuse, $209.65; lumber and coal, $34.78; paid secretary and for advertising, $70—leaving a balance of $15 in the treasury. Report ordered printed for the benefit of the stockholders—an example which should be followed by every incorporated company.

Five tons of rock are being hauled from the Morning Star claim to Wade & Schetter's mill, at Markleeville, for the purpose of being crushed. It will then be taken to the Brunswick works, near Empire City, for the purpose of having the mineral extracted therefrom. These works are just completed, and are constructed upon the English plan, of roasting and extracting silver and copper ores. So confident are the owners of the works as to the value of ore from this mine, that they assume the cost of hauling and working the rock themselves. The distance from the mine at Mogul to the works is forty miles.

We collate the above items from the Monitor *Gazette*.

SIERRA.—We learn from the *Mountain Messenger* that the old Blue Tunnel still shells out the precious ore. The Central Company are putting in machinery to hoist with one of Fredenburg's wheels. They have a propelling power of 220 feet pressure and more than sufficient for all purposes. Their tunnel is straight, and thoroughly timbered.

The New Orleans Tunnel, which has been in progress some six years, and running for the richest gravel range that has been tapped among the Sierras, is now near the desired point of more interesting operations. It is supposed to be low enough, and if the present contract does not strike gravel it is the intention to raise up to it with a shaft or scbute.

MINING IN AMADOR.—A correspondent of the Amador *Ledger*, writing from Pine Grove, says: Our mining interests are progressing satisfactorily. I understand that Reiching & Wendell, of the Tullock mine, have sold, or are about to sell, half their valuable lode for $15,000. The Anaconda sold an interest for $1,200, and Miller, Bradshaw & Moore sold their placer mine on Elsc creek for $2,100. These facts will give you a better idea of the value of our mines than anything I might say of them. A new quartz mill will probably soon be put up here; it is much needed. Dr. Paugh will have the Union completed within a few weeks, when prospectors will have a chance to test their rocks fairly.

SAN ANDREAS.—This old mining locality bids fair to realize something prosperous from its old claims, which were once among the richest in Calaveras county. The *Register* says: The citizens of this place have about completed arrangements to open and work some claims which have been partially worked in years past and paid very rich, but the labor on which was suspended on account of the water and the claims being so situated that they could not be drained without interfering with the rights of others. There are some half dozen claims located on a channel near the town, one above the other, and only one direction in which they can be drained. The lower one on the channel, known as the Dunning claim, has been worked out and paid rich. The one above it has been partially worked. The next one is owned by J. L. McFall, who has agreed to put a cut through the next claim and drain it for $800. This amount is already raised, and the work will soon commence on the claims. This claim which is about to be drained is known as the Marlette claim, and paid very rich until the water drove the miners out. This claim being opened, it is proposed to run a cut through to those above, and thus mining operations will be carried on in all the claims, giving employment to a number of miners and helping business generally. These claims are known to be very rich and will yield largely if they can be properly worked.

WASHOE.

A more cheerful feeling is evidently beginning to prevail in Nevada Territory with regard to mining operations. This feeling is, in fact, accompanied with active present improvements, and springs from the actual evidence which the mines are giving of their undoubted wealth and permanence. A few mills have stopped running, while others have increased their business. The mines on which operations have been discontinued are mostly of an unpromising and unproductive character, so that there has been but little, if any, falling off in the shipments of bullion. Important advantages have been secured during the past few months in improved machinery and manipulation, by which the ores have been more closely worked than formerly. Several mines have recently come upon richer ore, and in such quantities as it is believed will soon be materially felt in swelling the general aggregate of yield. Among these late strikes we may particularly note that in the Yellow Jacket, though the Crown Point, Imperial, Alpha and Milton are each worthy of mention. We append our usual summary:

THE Fairview, at a depth of 400 feet, says the *Union*, have run a drift 150 feet west, and penetrated the Comstock ledge to the extent of 80 feet. How much wider the ledge is at that point they have not yet ascertained, but the Milton Company adjoining it find it to be 190 feet in width. The Fairview Company, in the bottom of their drift, have just struck some very rich ore, and are now busy sinking their main shaft 100 feet deeper, when they intend drifting again to their ledge. The rich ore they have now struck lies in streaks and boulders in the main ledge, and shows conclusively that they have something pretty good below them. They are going after it.

NEW MILL.—The agent of a New York company, says the Dayton *Sentinel*, has made a contract with Mr. I. N. Taylor, of this county, to put up a fifteen-stamp mill with an engine of forty-horse power, on the claim of the Ætna Company, in Sullivan District. The necessary papers are now on their way to New York for the approval of a company there, who are to receive an interest in the mine for the erection of a mill. The Ætna is considered a valuable claim, having yielded at the rate of $33 per ton under the stamps, and being situated in the midst of plenty of wood and water can be worked to good advantage.

THE Confidence mine, on the Comstock ledge, is located at the upper part of Gold Hill, near the Divide. The motive power is a 20-horse power steam engine, of a very superior construction. At a distance of ninety feet from the main shaft, according to the *Union*, they have recently discovered a vein of very rich ore in the main lead, which they have penetrated to the extent of eight feet with a small drift, and how much thicker it is they do not know. An assay of a select piece of this ore, made on the 7th inst., went $462.44 in silver and $159.58 in gold; total $618.12 to the ton. An average assay of this ore went $361.12 to the ton. The class of ore which they have been working until the present rich strike, yields at the mills from $40 to $60 to the ton. As might be expected from such a yield, the finances of the Confidence Company are in a healthy state, they declaring a dividend last month of $100 per share. From their lower level, Burke & Co. are now running a side drift, to connect with their works from the Michigan shaft, for mutual benefit in the way of air.

THE Granite mill, located in the upper part of Cold Hill, is owned by Darst & Tructt. The mill structure is built of granite, and contains two batteries of eight stamps each, the motive power being a 40-horse Corliss engine. Coleman's "Little Giant" Amalgamator is used at this mill. Its performance is highly spoken of by the reporter of the *Union*, from which paper we gather these particulars.

THE Gold Hill *News* is informed by Mr. Oullahan, Superintendent of the Green Company, that on Thursday evening of last week he struck a new and unexpected ledge, with a westward pitch, from which he took some average rock, which he had assayed by H. Harris, of Gold Hill. The returns show, per ton of 2,000 pounds, $5.52 silver and $113.13 gold, making a total, per ton, of $118.65. From the old ledge, which is a silver ledge with an eastward pitch, an assay shows, to the ton, of silver $19.74 and of gold $6.28; total, $26.91. The above assay was taken for the purpose of satisfying the company with regard to the actual value of their ledge, and not to influence the market.

REESE RIVER.

The *Reveille* speaks quite cheeringly with reference to the mines about Austin. It asserts that more confidence is felt by persons interested in the mines of that region than at any previous time, and that that confidence is daily increasing. "Feet" that a few months since would not sell for assessments are now sought for eagerly. Work has also been resumed on many claims, some of which have been lying for a long time idle. Whims and windlasses are being put up, tracks laid, and the general work of development is being pushed forward with a vigor and energy never before displayed. The mills are all giving satisfaction, and are crowded with work. We quote from the *Reveille*:

The Farris mill has recently turned out a lot of bullion from the Whitlach ore that assayed the astonishing fineness of 998, lacking but two-thousandths of being absolutely pure silver. This was from sulphuret rock, was roasted and amalgamated in tubs by a new process adopted by Mr. Zottman, and first used now. The improvements at Farris' mill are now completed, and this was the first work in the new tubs. The amount worked was one and a quarter tons, and produced $831.33. We begin to believe our mills can do as good work as those of any other locality, and a little better; and that our mines do not need salting from those of Esmeralda nor of Washoe.

The Buel North Star is now, at a perpendicular depth of 100 feet, turning out a splendid variety of ore. We were shown by Mr. Kurtz, the Superintendent of the mine, a certificate of assay, and a sample of the rock assayed, that went as high as $2,274 per ton. The specimen is made up of black sulphuret of antimonial silver ore, with white quartz, making the whole a dark but glistening iron-gray. The lode of this is twelve inches in width, and is turning out large quantities.

The Shoshone Company have been taking out some very rich ore, and have probably had a large lot of it worked at the Oregon Mill, the past week.

The work on the new sixteen-stamp mill, in Telegraph Cañon, is progressing finely. Fifty men are employed in grading and doing the masonry work, and teamsters are hauling lumber, brick and stone. The machinery was daily expected.

The roasting furnaces, four in number, for the Oregon Mill, were to have been put in operation on the 5th inst. A new furnace for the purpose of drying ore, has just been built at this mill. It is arranged so that the flues of two of the roasting furnaces pass under it, furnishing sufficient heat to dry the ore. This makes it an economical arrangement, as the furnace heretofore used for this purpose consumed a cord of wood a day. The proprietors of this mill seem determined to have all the modern improvements, as they are continually getting something new.

The South American has an incline down 135 feet, and are now engaged in running a drift, from the bottom of the incline, in a westerly direction, from which they are taking some as rich rock, out of a fourteen-inch ledge, as has yet been discovered in the district. The drift is in fifty feet and the ledge constantly widening. The superintendent intends having ten tons of this rock worked at the Oregon Mill immediately. At the depth of one hundred and forty-five feet there is another drift run out eighty feet, obtaining from it some very rich ore. At a depth of fifty feet there is still another drift, run out twenty-five feet. Miners are at work night and day. It is the intention of the company to only have a sufficient quantity of ore worked to pay the expenses of working the mine, this winter; but they will keep a full force employed, so as to take out enough to supply two mills, if need be, as they expect to have it developed sufficiently for that, in the course of four months. Workmen are now engaged in erecting roasting furnaces at the Union Mill.

The Foster Ledge, which is down with an incline one hundred and twenty feet, are now putting up a whim, to be employed instead of hand power, as heretofore. The Hildreth mill has received the new castings and other apparatus necessary for a retort, and will have a new one built in a few days.

HUMBOLDT.

THE Humboldt *Register* of October 1st says that Professor Silliman was at that time examining the mines in that region, and so far as could be ascertained was favorably impressed with their appearance. Business of all kinds was improving, and a favorable season was anticipated during the coming winter.

THE Sheba mill is doing a good business working ore from the mine and making regular and satisfactory shipments of bullion to this city. The retort at the mill having been found too small, a larger one has been ordered.

THE Gipsy is a ledge recently discovered and located in Trinity district. It lies within one hundred yards of the now famous Evening Star ledge, and shows on the surface the same rich croppings which led to the fine body of ore now working in the Evening Star. The Gipsy crops out 18 inches wide, solid ore, and promises to prove a fine mine. There are 2100 feet in the claim, and the locators have commenced arrangements to get work commenced at once.

THE Moonlight shaft is being carried down and ore of the first quality extracted. A few tons of the ore was delivered at Fall, Price & Co.'s mill recently. If this claim was properly worked, it would be one of the best in the Territory. Few claims equal it in richness from the surface down to the bottom of the present shaft.

THE Mars Company has resumed work on their claim. They ceased work on it nearly one year ago, though at that time there was a good prospect that it would prove valuable. It is expected that this claim will once more resume its position as one of the best claims in the mountains. Heretofore it has been badly managed, and the stock has become almost worthless. Mr. Thompson, the Superintendent, is an energetic worker, and as he has determined to take hold of this claim in earnest, he has made arrangements with Full, Price & Co.'s mill to work the ore as fast as it is taken out.

ESMERALDA.

We find but little news of interest from this locality. The miners appear to be generally at work and apparently with satisfactory results. We clip the following Owens River items from the Esmeralda *Union*:—

RICH ROCK.—We are informed that Mr Wellington, proprietor of the Aurora and Carson Stage Line, has in his possession a silver brick taken from six pounds of ore from Montgomery district, which is valued at $36. We are inclined to believe that if the leads of Montgomery district contain much rock like that somebody is going to get rich.

SMELTING WORKS.—Mr. Frank Hutchinson, of this city, we are informed, has erected a smelting furnace at Montgomery, and is now taking silver out of the rich rock in which that mining district is said to abound.

RICH STRIKE.—Mr. D. Cohn informs us that on Saturday last the miners in the Forrestville Tunnel struck a lead. During Monday and Tuesday they worked four feet into the lead, and at last accounts they were not through it. The ore is very rich.

MISCELLANEOUS.

THE BOISE GOLD CROP.—The Dalles *Messenger*, of recent date, says that on inquiry of leading business men, it learns that the gold crop for the current year is full one-third greater than that of 1863. Some of the districts—Cañon City for instance—have doubled their yield, and all of them show a large increase. According to the published statistics, the yield of our mines for 1863 footed up $8,000,000. For 1864, we feel warranted in saying that the yield will be considerably over $12,000,000. With the introduction of mills, and improved facilities for mining, we have every reason to believe that another year will find our gold crop doubled.

THE KOOTENAI MINES.—The *Golden Age* says that Sherwood, of the Kootenai mines, brings no account of any very late discoveries since last report, except on the Columbia, where the miners are said to find fair pay. A merchant by the name of Cuddy, was robbed at Fisherville, a short time since, of $7,000. He was engaged in a "fisty-cuff" in the street when some one entered his store and stole the above amount in gold dust. Reynolds & Co. took out a nugget weighing thirty seven ounces and valued at $666. This is the largest piece that has yet been found in the Kootenai mines.

It is Impossible for editors to know ALL the merits and demerits of their correspondence, consequently the reader must not receive the opinions of our contributors as our own. Intelligent discussion is invited upon all sides and the evidence of any error which may appear will be received in friendship and treated with respect.

American and Foreign Patents.—Letters Patent for inventors can secured in the United States and foreign countries through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past year.

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the MINING AND SCIENTIFIC PRESS, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

San Francisco:

Saturday Morning, Oct. 15, 1864.

WHAT WE EAT.

Within the past quarter of a century eating, practiced as an art from time immemorial, has assumed the dignity of a science. Chemistry now controls the kitchen, and what we eat and drink is noted for their effects on the human system, as the mixing of metals are in making proper alloys for the manufactory. The principles of chemistry applied to the food we eat, has disabused people's minds of many an old delusion. Arrowroot and sago are no longer considered among the first of nutritious substances; they have been weighed in the balance of science and found wanting. The study of chemico-culinary works has become so almost universal that every well educated housewife can descant on the qualities of oxygen, hydrogen, carbon and nitrogen, and their action on the human system; and it is a curious part in this connection that as this knowledge becomes more general and is practically applied, the general average of the duration of human life becomes lengthened, Actuaries of life insurance societies, who calculate, as a matter of business, the probabilities of human life, have made all the matters connected with its duration a matter of such close study, have brought so much science and observation to their aid that they can almost calculate to a year the length of time any man or woman will naturally live by a knowledge of the manner in which they eat and what food they partake. The chemistry of food goes farther than this. It proves incontestibly that man is made up of air! The scripture text which says that from dust he came and to dust he shall return, is not quite correct in fact, according to science. It is from air he comes, upon air he lives, and to air he must return—which is so easily demonstrable that we are surprised that everybody does not "see it." Man feeds on plants, directly or through the mediation of herbivorous animals; plants feed on carbonic acid gas; ammonia and water, which impregnate the atmosphere. On these plants, or the animal that feeds on them, man is fed; and when grim Death takes from him the divine spark of life, that which remains dissolves into carbonic acid gas, water and ammonia—and so the eternal course runs on. Why, if man returned to dust, and that dust remained as a fixed fact there would be strange unsightly piles of it in such old countries as Egypt, Asia and Phœnicia—countries that began to be populated when Adam himself was a mere youth. There has been dead enough buried in Damascus, calculating that the dust of each generation would add but an inch to the pile, to have buried that venerable old city "full fathoms deep," even since the original Father Abraham paid a visit to it, when it was quite a respectable township.

But this is not the part of the subject we had intended to refer to. We started out with the subject of the minerals we eat. According to absolute experiment, a full grown man of average proportions will weigh 154 pounds; of this all but 38 pounds is water—even in the greatest whisky guzzlers; of this 38 pounds at least 10 are composed of mineral matter—such as lime, quartz, iron, sulphur, phosphorus, soda, potash and magnesia. It is not true that lawyers or editors have any more brass in their composition than parsons or fiddlers, though there is a very marked difference in the quantity of iron some men's bodies contain as compared to others. A man of iron nerve is not so much a figure of speech as many suppose. We are all men of metal; but, as Shakspeare says, there are some of the "baser sort."

It will perhaps astonish some of the natives to learn that salt—common salt, a compound of chlorine and soda—forms the chief mineral in the human form divine; so that when the scriptures tell us that man is the salt of the earth, the expression is literally as well as figuratively correct. The man who prides himself on his "muscle" is but little aware how much that muscle depends on potash—a capital substance to make lye—not lies—don't misunderstand us. Nature never lies; that is a power left to man alone. There is iron enough in the blood of a healthy man to make a ring large enough to wear on his finger; sulphur enough in his hair, unless he be bald-headed or "runs with a machine" and has it all cut off, to make a box of lucifer matches; lime enough in his bones to help to build any amount of brick wall; flint enough to strike a light. Some men—particularly presidents of mining and railroad corporations—have an excess of flint in their composition—a considerable steal, too. We shall, in the next article on this subject, describe the processes by which man gathers these minerals from his food as the bee sips honey from the flowers.

GOLD IN CRYSTALS.—A crystal of quartz, of fair size was recently found in Castle Reef, Raspberry Creek, Australia, in which was a hollow containing a little lump of gold. The precious metal fills up its transparent nest, and protrudes a little beyond. The crystal is otherwise perfect, and a gem of its kind, albeit a finer specimen, judging from the above description, was some time since on exhibition in this city, having been taken out of a quartz ledge in this state. These two specimens, so far as our knowledge extends, are the only instances known of the occurrence of gold in quartz crystals. The crystals, in both cases, were undoubtedly formed subsequently to the gold, which became enveloped within the crystal during its process of crystallization.

AN ENGLISH RAILWAY ACCIDENT.—A locomotive engine recently exploded on the North London Railway, at the Camden road station. The train had just brought up on the middle of the Randolph street bridge, when the locomotive boiler exploded throwing the engine upwards and forward several feet high, breaking the telegraph wires which passed along overhead. The engine turned completely round and also described a summerset in its leap, and landed on a piece of open ground below the bridge—squarely upon its wheels! The fireman and driver were both badly but not fatally injured, the latter being thrown a distance of twenty yards. No passenger was injured.

KEROSENE EXPLOSION.—Some careless person placed an empty kerosene oil-can on a stove in Virginia City, the other day, for the purpose of cleansing it. Of course a large amount of gas was soon generated, and as the hole in the top was stopped up, a violent explosion occurred, producing quite a fright and attracting a large crowd.

TELEGRAPHIC COMMUNICATION WITH HUMBOLDT.—The California State Telegraph was completed to Star City, Humboldt, N. T., on Monday last, and the first dispatches between that city and San Francisco passed over the wires that day. Arrangements have been made with the local express company there by which messages for Boise, Idaho and intermediate points will be delivered in three days.

OHIO makes eight million two hundred and eighty thousand pounds of sugar per annum from sorghum.

OIL WELL SPECULATION IN PHILADELPHIA.

According to the Philadelphia *Mining Journal*, there are now afloat in the Philadelphia stock market, shares of stock issued by about 115 oil well companies and valued at $7,000,000. The total number of capital shares issued by all the railroad companies in Pennsylvania, that use locomotive power, does not exceed two and a half millions, being but little more than one-third the number of capital shares issued by the oil companies organized in Philadelphia alone. The 3,300 miles of locomotive railroad in use in Pennsylvania cost $200,000,000, and yet this vast property is represented by less than one-fourth the number of shares issued by the companies owning the oil wells in Pennsylvania.

It would appear from the above that a speculative mania, similar to that which has existed in this city for the past two years, is about to be inflicted on the Pennsylvania public.—Speculators who are interested in the original allotment of shares, and brokers whose commissions are imposed on the number of shares bought and sold, are the parties specially benefitted by this plan of company organization, because it is impossible to keep the credit of even a producing oil company on a stable basis, where the shares in the market have such a small proportion of actual value to the real worth of the property represented. Shares thus issued on speculation float about in the market like corks on the water, bobbing up and down with every ripple upon the surface. There, as well as here, it will not be until most of these companies have consolidated or contracted their shares that they will be held more generally for investment and less for speculation. The sooner our speculative companies begin to organize on a more reasonable basis, the sooner will capitalists begin to buy with the view of regular development and permanent investment. People are heartily tired of purely speculative operations in mining stocks. Our faith in the mines has never for a moment wavered; but the present stock basis we believe is deceptive and wrong, and is sadly in need of a re-adjustment.

Gold Product of the Australian Colonies.

An official return has recently been issued of the quantity and value of gold exported from Australia and New Zealand from 1858 to 1862, both inclusive. The following are the figures from New South Wales, given in round numbers:—

1858	$250,000
1859	407,000
1860	675,000
1861	950,000
1862	714,000

The returns from Victoria, as given in the authority before us, are stated in ounces, which we have converted into Federal currency, at the rate of $17.50 to the ounce.

1858	$44,715,500
1859	39,903,750
1860	37,251,550
1861	34,630,120
1862	32,942,840

The total amount of gold exported from the several gold-producing localities in New Zealand from April 1st, 1857 to September 30th, 1863, is also given in ounces, which we have converted into Federal currency, as above:—

Otago	$20,650,870
Nelson	1,144,655
Auckland	93,0 5
Total from New Zealand	$21,888,540

The above forms a very interesting exhibit of the gold yield of the Australian colonies for the six years prior to 1862. We do not recollect to have met with any statement of the kind for several years, and we presume it will be new to most of our readers.

SIMPLE MODE OF PURIFYING WATER.—It is not generally known that pounded alum possesses the property of purifying water. A tablespoonful of pulverized alum sprinkled into a hogshead of water (the water stirred at the same time) will, after a few hours, by precipitating to the bottom the impure particles, so purify it that it will be found to possess nearly all the freshness and clearness of the finest spring water. A pailful containing four gallons, may be purified by a single teaspoonful of the alum.

IRON SHIP BUILDING.

It appears to be pretty generally conceded, at the present time, that the day is not far distant when the most of our merchant ships will be built of iron instead of wood. Some of our most eminent shipbuilders at the East, among whom we may enumerate Donald McKay, the builder of the Great Republic, and McKay & Aldus, are making preparations for this important change in their business. Both the firms named are at the present time constructing iron ships, of small tonnage. As soon as any material abatement occurs in the present high prices of iron and coal, we may look for much activity in this class of ship building. May we not reasonably hope that our late wooden mercantile marine, the great bulk of which has so recently been transferred to the British flag, to avoid the dangers of English built pirates, will, when replaced, be built up of the more enduring material now coming into vogue?

Our mines of iron and coal are inexhaustible. Coal for fuel and iron for our ships and machinery, if properly brought into use, will in ten years of peace place us immeasurably in advance of the relative position we occupied among the nations of the earth at the breaking out of the existing rebellion. The war has in three years given an impulse to our iron interest which an entire decade of prosperous peace would not have created. Furnaces, rolling mills and foundries are multiplying in Pennsylvania at a most unprecedented rate. It was this class of industry which was developed in Great Britain during her Napoleonic wars, that gave that country such a sudden prominence among the nations. It is in the iron mines and ore beds of England that her strength lies. The former are useless without the latter. Already, her *savans* tell us, symptoms of an early failure begin to appear in her coal mines; while the same class of mines in this country are year by year developing more extensive proportions, until they are now pronounced inexhaustible. It is the possession of these extraordinary sources of material wealth and power, developed by Anglo-saxon energy and enterprise that is destined, with the next generation, to make this country the overshadowing power and master nation of the earth.

FOREIGN MINERS FOR LAKE SUPERIOR.—A great number of foreign miners are now finding their way into the Lake Superior mining region. At last accounts 428 Swedish emigrants, chiefly miners, had just arrived there. There appears to be a Mining Company's Association organized there, which has sent agents to Europe to encourage this class of emigration. One of these agents writes from Gottengen, under date of July 20th, that on the Saturday previous one of the finest steamers in Sweden left Stockholm for America with 240 of this class of emigrants, and that 125 had sailed a few days before; 400 others were expected to sail from Norway by the last of August, and some 800 more still by the first of March next.

The systematic measures in operation to stock the copper mines of Lake Superior with trained and skilled European miners, seem to promise entire success. Every intelligent miner imported into the Lake Superior region is sure to write back to his kindred and friends such accounts of high wages and such descriptions of lodes, rich in virgin copper, as cannot fail to swell the number of emigrants, and thereby rapidly increase the product of the region. The markets of the world are open to Lake Superior copper, which now commands a *thousand dollars per ton*. Might not the general interests of California be improved by a similar systematic effort to encourage emigration to the Pacific coast?

CURE OF SCARLATINA.—Among the recent patents granted to Californians we notice one for a medical composition for the cure of Scarlatina, granted to Mary Ann Ragsdale, of Grass Valley, in this State. She claims an ointment, and a gargle, the same being a new manufacture.

HOME IMPROVEMENTS.

The dull times do not seem to have much effect in retarding improvement in this city. The same activity which has been noticed for the past twelve months still continues in the way of building. In every part of the city we notice buildings constantly in progress, most of them of a very superior order, whether for dwellings or stores, and some really elegant, such as would be an ornament to any city. Gunpowder and muscle are also making rapid inroads into the more prominent topographical features of the city. Wide chasms are being made through some of the hills, and the rough acclivities of others are being rounded into more comely shapes, while others still are being crumbled and carted away down to their very foundations. The pick and drill which so long and so persistently worked away at Telegraph Hill, are now doing a heavy business in undermining the bluff between the foot of Second and Third Streets. The work commenced in that vicinity, last season, by the new gas company, is now being carried along the entire face of the bluff to Third street. The old lime kiln, which for so many years has reclined its broad sides against this bluff, now stands out quite a distance from its former support—a monument of the early days of our city, and the former follies of some of its business men. The extensive wharf and substantial buildings for the accommodation of the gas company, are being rapidly pushed toward their completion. Workmen commenced on Monday, at the foot of Third street, to lay down the main gas pipes of the company, and a broad and substantial road is being constructed upon the regular grade to reach their works. This road, we presume, will, or at least should be, continued around that entire portion of the city front until it intersects Main street near the deep cut through Harrison. This portion of the town is rapidly assuming an important aspect, and indeed must eventually become the central and radiating part of the city. Not less than eight thousand people visited the foot of Third street on Sunday last, chiefly to take a look at the "Washoe" and "Camanche." We notice that the "ways" are being laid, and preparation made for the launching of the latter. Apart from these two objects of attraction, Third street is fast becoming a great thoroughfare for pedestrians and street car travelers, who would seek a few moments of respite from the turmoil of crowded streets, and to get a long breath and snuff the pure salt water breeze from the Third street wharf or adjacent highlands.

ANSWER TO QUERY.

Editors Mining and Scientific Press:—With your permission, I will endeavor to answer the questions, asked in your last issue as to the power of a turbine under a pressure or head of 100 feet using twenty-five inches of water, miners' measure, as used in our State.

According to the formula of Poncelet and Lesbros, (see Weisbach, American edition, page 368, Vol. I) the quantity of water discharged through a lateral orifice = M. a. b. $(2g. h.)^{\frac{1}{2}}$.

a designating depth of orifice, *b* designating breadth of orifice, *h* designating pressure at the orifice, and *M* designating co-efficient of effiux for this case = 0.64, *g* of acceleration of gravity. The quantity of water discharged per second accordingly = 0.6 cubic feet.

This discharge, calculated to take place through a rectangular orifice in a thin plate is sufficiently correct for practical purposes, if the aperture is cut in a one inch rough board; as the experiments made by the writer for a large miners' ditch company in Nevada County, a few years ago, have satisfactorily demonstrated. The aperture, through which the water flows should however not be higher than two inches, as the discharge becomes less, the deeper the orifice.

Knowing the quantity of water, carried by twenty-five inches miners' measure, to be equal to 0.6 cubic feet per second, the *mechanical effect* of the water at disposition, with a head of one hundred feet = $A.j.h.$ (where $A.$ designates the discharge of water per second, j the density of the water and h the fall) = $0.6 \times 62, 4 \times 100 = 3775$ feet lbs.

As the question above specified does not specify the kind of turbine to be used, we will substitute the efficiency of a turbine, perhaps best suited to the case, of one of Whitelaw's = 0.7 (30 lbs of pressure or head of water being lost by friction in the pipe, shock, resistance to entrance, etc). (Experiments on Whitelaw's turbines as made by Messrs. Randolph & Co., of Glasgow, give results varying from 0.6 to 0.75 for the efficiency).

The *useful effect* therefore is $0.7 \times 3775 = 2640$ feet lbs or nearly 5-horse power.

In the same manner the useful effect of a turbine (pressure fifty feet, quantity of water used 144 inches) is found to be nearly 14.6 horse power.

G. F. Deetken, M. E.

The California Powder Works, located at Santa Cruz, are now in successful operation, and are prepared to furnish mining and blasting powder of a quality equal to the best imported. This enterprise is the first of its kind which has been established on the Pacific coast. The company is incorporated, and consists of ten stockholders, each of whom has paid into the capital stock $20,000. Two and a-half years have been spent in erecting the works and bringing them to their present point of success. The stockholders have entered upon the enterprise for the purpose of producing at home an article of great and indispensable importance to the leading industrial pursuit of California. The isolated condition of this State and the adjoining Territories renders it a matter of the utmost importance that we should be placed in a position of comparative independence of foreign markets in this particular. In the present disturbed condition of the political world, this becomes a matter of still more especial importance, and renders the enterprise one eminently worthy the support of the California public. The present capacity of the mills is equal to the manufacture of about 70,000 kegs of powder per annum. The perfection of the machinery and equipment of the mills is believed to be equal to any in the United States or elsewhere. The location of the works is convenient, and in a region abounding with the finest groves of willows, alder, etc., which furnish the best kind of material for the charcoal employed in the manufacture. The company import their saltpetre direct from Calcutta, the great source of supply of that material for the world; of which and sulphur they intend to keep a large supply constantly on hand. The mills of the company are thirteen in number; the whole number of buildings connected with the works is twenty-five. The mills are located at safe distances from one another, and connected by tram-ways. The power is derived from the waters of the San Lorenzo river. The office of the company in this city is at 318 California street.

Rich Rock.—Messrs. Kimball & Murphy, of the European Metallurgical Works, on Bryant street, in this city, have recently been working some very rich rock, from various mines in the interior. Among the lots worked, we are permitted to mention one from the "Gem of the Sierra," Humboldt, N. T., which yielded at the rate of $1,030 per ton. Another lot of 1,540 pounds, from the "Monitor," Tuolumne county, assaying $612, yielded, by practical working, at the rate of $532.50 per ton. A lot from the "Refugio," Mexico, yielded its gold and silver more freely than usual; it assaying $85 in gold and $247.95 in silver per ton, and yielded, by working process, $80 in gold and $214.46 in silver. Messrs. Kimball & Murphy have one of Prater's Concentrators at work in their metallurgical establisbment, which they assure us is a most efficient and useful piece of mining machinery, as by it much can be saved that is usually allowed to go to loss—viz: floating quicksilver and sulphurets.

The Union Torchlight Procession, which takes place in San Francisco this evening, is expected to be the most extensive demonstration of the kind ever made on this coast.

HOME FINANCES.

The money market is growing easier and there is an evident tendency to lower rates of interest upon first-class securities. Capital has been accumulating for some time past and the volume of money now available for loan purposes is greater than at any former period during the year. Nearly a half million dollars have been received here lately from eastern parties for investment in Real Estate and Mining Stock, and the different agencies of British Banks are preparing to extend loans and other facilities to the business community. Notwithstanding the severe and protracted drouth which has prostrated so many interests in the interior, and the losses our own people sustained early in the summer in the speculative arena of the Stock Exchange, a general prosperity may be noticed at this time among all classes. The mining interests are looking up again and will doubtless soon attract more attention.

The product of the precious metals on this coast since January last has exceeded $40,000,000 of which sum Nevada has produced $11,000,000 and British Columbia, Oregon and Idaho some $5,000,000. This is a gratifying exhibit and will have the effect to encourage and stimulate this leading pursuit and all important interest. Our exports of treasure for the past nine months have reached an aggregate of $44,000,000 of which amount $28,000,000 were sent to England, $9,000,000 to New York and some $6,000,000 to China. The Sub Treasurer's shipment of $6,000,000 is included in our remittances to England, against which bills were drawn and sold by the authorities at Washington. The disbursements on this coast for the past three quarters of the current year amount to $8,500,000 chiefly in Legal Tender notes, and the revenue for the same period $6,700,000 including $4,800,000 in gold from duties on imports.

A fair business was done on last steamer day on Exchange, and the shipment of treasure reached $1,200,000. Currency Bills were sold at 85@90 per cent premium on gold and Telegraphic Transfers ruled at 5½ per cent premium. Legal Tender Notes are selling in moderate quantities at about 52½@53½ cents.

We publish this week the promised paper on Crucibles and Fire-proof Materials by Mr. J. H. Churchill, A. M., now of this city. It was originally read before the American Institute of New York, and published in their proceedings, but the importance of the subject in our own State and the marked care with which the results of so much observation and practice were collected, render it deserving the attention of our readers.

Gun Cotton to be Tried.—We understand that parties in this city, heavily interested in mining, have ordered from the East a quantity of gun cotton, manufactured after the Austrian formula, sufficient to make a practical test of its for utility blasting purposes. We are promised the result of the experiments as soon as they have transpired. Should they prove what is expected, the above parties are prepared to import for sale in any quantity which this market may demand.

Digest of Laws.—Mr. Thompson H. Hittell, of this city, has nearly completed a Digest of the Statutes of California from 1850 to the present time. A compilation of this kind, carefully prepared, is much needed, not only by the legal fraternity but by business men also throughout the State. Mr. Hittell is said to be eminently well qualified for such a work.

A Self-Emptying Basket is enumerated among the late useful inventions for the horticulturalist. The basket is so constructed that it may, by means of a cord, be let down from the highest tree, and deposit its contents upon the ground or in barrels, with but little effort on the part of the picker, thus materially reducing the labor of gathering fruit.

An English steamer, lately built, has the escape pipe leading from the safety valve under water, so as to avoid the unpleasant noise caused by blowing off in the air.

EASTERN FINANCES AND TRADE.

Our latest Eastern mail advices are to the 13th of September. At that date all business seemed to be devoid of any animation, save in the prime necessaries of life, which rose and fell daily, more or less, in sympathy. Gold speculation seemed to be most active in the provision line. Cotton had been in better request, and was selling at 185@187 ₱ lb. At a large auction sale of Magadore, Montevideo and California wool, prices ranged from 26½c to 57c ₱ lb.

The Dry Goods trade was exceedingly depressed, and importers, commission houses, jobbers and retailers were all complaining of the trifling demand. Buyers anticipated a sudden break-down in prices, and were disposed to stand off. Speculative operators were more circumspect, and anxiously watched the fluctuations in the gold market as well as the political signs of the times. All stocks of general merchandise in the hands of legitimate dealers are thought to be small.

In the condition of the finances, no material change is apparent, either in the supply of capital or the demand for its use. The current rate of interest charged for demand notes was 6 ₱ cent. per annum; and discounts of first-class commercial paper were effected at 7@9 ₱ cent.

The Government was requiring a good deal of money, but nearly all the national securities on the market had advanced and were in good request. They were believed to be not only cheaper than local stocks, but safer as an investment in view of the prospects of an early peace. Orders from the continent of Europe continued to reach New York for the ten-forty and five-twenty bonds of the United States, at *the market rates*. The payment of the interest on these bonds in gold, long before it was due, stimulated this foreign demand, and was productive of much good at home.

The Santa Barbara Sufferers.—The Committee appointed to distribute the contributions collected in this city for the sufferers in the southern counties have addressed a letter to Mayor Coon, of this city, in which they state that notwithstanding the actual existence of a large amount of suffering in Santa Barbara, for the lack of provisions, which may be readily ascertained by any one who will take the trouble to go where the suffering is, there are still people in that city who ignore its existence to any extraordinary extent. Others, while they admit its existence insist that local charity is quite sufficient to relieve the wants of the truly necessitous. The committee, however, insist to the contrary, and assert that it is a case entirely beyond the power of the citizens or local authorities to adequately meet. A list of forty-three families, in Santa Barbara alone, embracing over 200 souls, mostly women and children, has been prepared, where extreme destitution prevails, and the committee had not up to the time of writing been able to visit other sections, in the interior, where quite as much distress prevails. The Committee, however, feel justified in saying that assistance already received and now *en route* has been most opportune; but the amount has been such that in their opinion no further supplies need be forwarded unless especially called for by the local authorities. Thanks for the prompt and generous action of the citizens of San Francisco is expressed by the committee of distribution, and the blessing of Heaven is invoked upon the donors.

Some Ingenious Inventor, at Vienna, has recently succeeded in transposing (photograph) to copper plates. It is said that the pictures taken by the process are beautifully executed. The invention is a useful one, but not entirely new, as the same thing has been done for some time in New York, but whether by the same process we are not informed.

The new Sacramento steamer now in process of construction at Hunter's Point, will be thirty feet longer than the Chrysopolis and in every way her superior. The Chrysopolis is now the largest and finest boat afloat on the inland waters.

A Query.

EDITORS MINING AND SCIENTIFIC PRESS:—Allow me to ask you and other scientific gentlemen, through your paper, a question on which I have doubts and from an answer to which the mining community of this district may be more or less benefitted.

About 20 miles from Austin, in a southeasterly direction, we have found considerable masses of asphaltum, derived from springs opening up from various crevices and cavities occurring in an immense mass of metamorphic rocks, of a compact nature. These rocks are separated from a well-defined slate range by a limestone strata formation, from 60 to 70 feet in width. The general formation of the mountain range there is of a stratified character—the above-mentioned compact masses forming merely an exception. In the adjoining slate range, which is very extensive, we have found beautiful specimens of petrified wood. We have also found indications of soda in the neighborhood, and twenty miles southeast is the great salt bed of Smoky Valley; forty miles south of which we find the well-known and extensive hot springs of Smoky Valley.

Now the question which I desire to ask is: "Have we any reason to look for coal beds in that vicinity, and if not, what originates the asphaltum, and how came it there?"

AUSTIN, N. T., Sept. 29, 1864. F. A. M.

In answer to the above "query," we would simply say that the description which our correspondent gives of the region alluded to is quite sufficient to attract much interest and importance to the locality; but the data given are not such as to enable any one, who has not seen the locality, to answer his enquiry in a manner which would be at all satisfactory to either the enquirer or the writer. If we were to express any opinion whatever, it would be that the indications are more favorable for the development of oil wells, than for coal mines. The generally received theory, at the present time, is that deposits of oil and asphaltum are not dependent upon the existence of coal. We may have more to say upon this at a future time.

VENTILATING ATTACHMENT FOR BEDSTEADS.—Under this title, John H. Martin, of Hartford, N. J., has procured a patent for an invention, the object of which is to obtain a device of simple construction which may be applied to a bedstead in such a manner as to be entirely out of the way of the occupants of the bed and be capable of raising and opening the bed-clothes at any time when desired, for the purpose of airing or ventilating them, and at the same time be capable of holding the bed-clothes in proper position on the bed when the latter is in use. The invention is designed to supersede the laborious hand-work in making beds, and to afford facilities for airing and ventilating the bed-clothes so that the same may always be in a cleanly and wholesome condition.

ANT TRAPS.—Among the various devices for getting rid of these little pests, we have met with nothing which promises better success than the following:—"Procure a large sponge, wash it well, and press it dry, which will leave the cells quite open; then sprinkle over it some fine white sugar, and place it near where the ants are troublesome. They will soon collect upon the sponge and take up their abode in the cells. It is only necessary to dip the sponge in scalding water, which will wash them out dead by the tens of thousands. Put on more sugar, and set the trap for a new haul. This process will soon clear the house of every ant."

INCENDIARIES seem determined to destroy the city of Stockton. Several fires have occurred there of late, which were undoubtedly their work. Three were kindled on Saturday night last. The citizens are taking measures to break up the gang.

AN INGENIOUS MECHANIC of Worcester, Mass., has invented a self-operating machine for spinning wool, that saves half the labor and cost of the best of its predecessors.

"THE TEMPLE OF SOLOMON" is the title of a pamphlet of about eighty pages which has been laid upon our table by A. Roman & Co. This pamphlet is the substance, somewhat enlarged upon, of an address which has been delivered, at different times, by Orceneth Fisher, K. T., before various Masonic bodies, during the last two or three years. It is intended, more especially, for the members of the Masonic Fraternity, but will be found valuable and interesting to all who desire to obtain even a superficial idea of the principles and teachings of the mystic brotherhood. It may be obtained at Roman's.

COAL EXPORT.—It was found to be a military necessity, some time since, to stop the export of anthracite coal, in order to meet the extraordinary Government wants for that material. It is now said that the exigency having passed, the President is about to revoke the prohibition, which revocation, it is thought, will have a favorable effect on the gold market.

The above is all correct with the exception that there is no such place as "Prairie du Chien, Illinois," no such paper as the "Prairie du Chien *Courier*," and the big bug of the size of a large bean, with an "L" on his back, is simply the "Seven Year Locust," which has visited the Western States at regular intervals ever since they were settled by white men.

WELL PUT.—The Folsom *Telegraph* in noticing the fact that the supervisors of San Francisco were at work upon an ordinance to keep pigeons outside of the city, suggests that while they are passing prohibitory ordinances they should also enact one prohibiting whales from entering the city limits.

A DESTRUCTIVE FIRE occured in San Juan, Nevada county, on the 6th instant, completely destroying the Chinese part of the town and considerable other property. It was only by great exertions that any portion of the town was saved.

"PUNDIT" AFTER THE "PROFESSON."—We have received a communication from our correspondent "Pundit," taking issue with Pro. Fessor Silliman's "theory" of the formation of the "chloride ores" in the "Grent Basin," and substituting one of his own. We shall give place to the new "theory" next week.

TEMPERING STEEL.—Ariel B. Sporus, of Hughesville, Pa., has obtained a patent for the use of a solution of soap suds or the component parts thereof, adapted to be increased or diminished in strength when employed as a medium for tempering steel in order to give it any degree of hardness, and prevent the same from cracking or checking during the tempering process, as explained in his specifications.

DIVIDEND.—The California Steam Navigation Company has declared a dividend of three per cent. on its capital stock, payable on and after the 15th inst.—two per cent. payable in coin and one per cent. in greenbacks.

"TRAVELER" has furnished us some important information from Indian Valley, Plumas county, for our next. The present No. is much enlivened by the valuable assistance of our contributors.

THE important feature of the week has been the election news from Eastern States—Pennsylvania, Ohio and Indiana having given decided Union majorities.

CAMELS AS CARRIERS.—Eight camels, loaded with flour, arrived from Folsom, California, at Austin, Reese River, on the 8th. They travel at the rate of forty miles a day, and seem not to weary.

MINING ACCIDENT.—On the 7th instant, W. H. Cumminsky, while working in the Grent Eastern mine, at Reese River, was injured by a descending car, which got disengaged from the rope on the whim.

FOR INCENDIARIES.—Some thirty merchants of Stockton have pledged themselves, in various sums to reward the individual who will detect and bring to justice the incendiaries who are now infesting that place.

CLAMEROUS people should remember that the tail of the rattlesnake makes all the noise, but the head does the execution.

MINING SHAREHOLDERS' DIRECTORY.

List of Notices of Meetings, Assessments and Delinquent Sales.

BRANDRETH'S PILLS are specially recommended for Stomach Coughs, Fever and Ague (which they surely cure), Asthma, shortness of breath and all obstructions. And if taken after too free an indulgence at the table, they at once restore the system to its natural state of healthy repose. Sold by all Druggists.

WHERE warmth is wanted; where the natural action of the surface is imperfect; where a surface is unnaturally hot and dry; where there is pain or weakness; and where there is numbness, imperfect circulation, or debility from an injury to the part, or from local rheumatism or paralysis, apply over or near the part, a Porous Plaster of DR. ALLCOCK. Sold by all Druggists.

RICHARD WEGENER,
Accountant, Mining Secretary,
AND GENERAL AGENT.
No. 204 Montgomery St., Southeast cor. Montgomery and Pine Sts., San Francisco. 11-m

Important Practical Application of the Spectroscope.

The English spectroscopist Roscoe has applied this new instrument of research to the manufacture of steel by the Beasemer process. One of the greatest drawbacks to the successful practical working of Bessemer's process for converting cast iron directly into steel has been the difficulty of determining the exact point at which the blast of air passing through the molten metal is to be stopped. The conversion of five tons of cast iron into cast steel usually occupies from fifteen to twenty minutes, according to the conditions of the weather, quality of the blast, etc. If the blast be continued for ten seconds after the proper point has been attained, or if it be discontinued ten seconds before that point is reached, the charge becomes either so viscid that it cannot be poured from the converting vessels, or it contains so much carbon as to crumble under the hammer. Up to the present time, the manufacturer has judged of the metal by the general appearance of the flame which issues from the mouth of the converting vessel. Long experience enables the workman to detect, with more or less exactitude, the point at which the blast must be cut off. It appeared to Professor Roscoe that an examination of the spectrum of this flame might render it possible to determine this point with scientific accuracy, and that thus an insight might be gained into the somewhat complicated chemical changes which occur in this mode of conversion of cast iron into steel. At the request of Messrs. John Brown & Co., of the Atlas Works, Sheffield, Professor Roscoe investigated the subject, and succeeded in obtaining very satisfactory and interesting results. The instrument employed was an ordinary Steinheil's spectroscope, furnished with photographic scale and lamp, and provided with a convenient arrangement for directing the tube carrying the slit towards any wished for part of the flame, and for clamping the whole instrument in the required position. By help of such an arrangement the spectrum of the flame can be most readily observed, and the changes which periodically occur can be most accurately noted.

The light which is given off by the flame in this process is most intense; indeed a more magnificent example of combustion in oxygen cannot be imagined—and a cursory examination of the flame spectrum in its various phases reveals complicated masses of dark absorption bands and bright lines, showing that a variety of substances are present in the flame in the state of incandescent gas. By a simultaneous comparison of these lines in the flame spectrum with the well known spectra of certain well known elementary bodies, Roscoe succeeded in detecting the presence of the following substances in the Bessemer flame—sodium, potassium, lithium, iron, carbon, phosphorus, hydrogen and nitrogen—a list to which further investigation with an instrument of higher dispersive powers than that employed would doubtless add other members. The investigation has already advanced so far that the point in the condition of the metal at which it has been found necessary to stop the blast can be ascertained with precision; and thus, by the application of Spectrum Analysis, that which previously depended on the quickness of vision of a skilled eye has become a matter of exact scientific observation.—*Abstract from the Practical Mechanic's Journal.*

Forage Plants for California.—The last vessel from Australia brought to Professor Brewer, of the State Geological Survey, a tin-lined box full of Australian seeds sent by Dr. Mueller, Government botanist of the colony of Victoria. Among these seeds were six packages of seeds of indigenous grasses or forage plants of Australia. It is known that there is a considerable resemblance between the climate of California and that of Victoria. Many of the plants of each thrive in the other. Australia has immense herds of neat cattle and sheep, which fatten on the indigenous grasses, and there is reason to hope that some of these grasses may thrive here. California is poor in forage plants. Not one of our grasses is strong enough to form a thick sod that will retain its vitality through the summer on the dry plains. Professor Brewer has devoted considerable attention to the subject, and so has Dr. Bolander, a botanist of this city. Experiments will be tried with these Australian grass seeds to ascertain their value. The introduction of a better grass than we now have would be worth the expense of a hundred geological surveys.—*Alta.*

Large Cannon.—It is an error to suppose the manufacture of large cannon a perfectly modern accomplishment. The twenty-two inch gun of Constantinople, and the twenty-eight inch guns of the Dardanelles, were made many years ago. The great gun of the Kremlin, in Moscow, is reputed to be the largest in the world. It is thirty-six inches in caliber, eighteen feet long, and weighs ninety-seven thousand five hundred pounds. The inscription shows it to have been made in 1586.

WHEELER & THAYER, Proprietors.
C. C. JONES, Amalgamator.
San Francisco, Oct. 13, 1863. j2tf

WHEELER'S
Amalgamating & Separating Pans.
It is acknowledged by all who have examined the principles and witnessed the operation of these Pans, that they are decidedly superior for triturating and amalgamating purposes to any other in use.
The most important principle connected with the operation of these Pans is the separation of the triturating process from that of extracting the amalgam from the sand.—The chief cause of loss of the precious metal arises from the passing off of the same in combination with the quicksilver, during the process of trituration, and in cleaning up. By the introduction of the Separating Pan to follow the triturating, this loss is entirely avoided. In working these machines there is no appreciable loss of quicksilver, and hence none of the precious metals.
Where these Pans have been introduced and operated by the side of others on sands from the same vat, the Wheeler Pans have uniformly gained a large percentage of metals, over its competitors, as well as a still larger percetage in the amount of work performed.
*** These Pans may be seen in daily operation at the Miners' Foundry, on First street, San Francisco, where all interested are invited to call and examine for themselves.
no16-tf ZENAS WHEELER.

Hepburn & Peterson's
AMALGAMATOR.
The subscribers would call the attention of the Mining Public to their Reducer and Amalgamator, and also to their Separator for reducing and separating the mineral from
Gold and Silver Ores,
Manufactured and exhibited at the Vulcan Iron Works, Nos. 137 and 139 First street, San Francisco.
These machines secure to the Miner a more Expeditious and Perfect Reduction and Amalgamation, a less liability to accident and delay, and a greater amount of useful effect in proportion to the power employed to keep them in operation than any other machine now in use for producing similar results. This fact is attested to be their general adoption and preference at all the principal Reduction Works in Nevada Territory; among which may be mentioned the Gould & Curry Mill, the Silver State Reduction Works, Zephyr Flat Mill, Pioneer Mill, Eastern Slope Mill, Phœnix Mill, etc.
☞ This Amalgamator may be seen in operation at Kustel Bros. works, Bryant St. between 3d and 4th.
(Illustrated in the Mining and Scientific Press, April 9th, 1864.) HEPBURN & PETERSON.
nov8 3m*

To Quartz Miners.
All persons interested in mining machinery are invited to call at the Pacific Foundry and examine my improved Amalgamator. It is unquestionably superior to anything now known for amalgamating Silver and Gold. It works 1000 pounds at a time, and will amalgamate over three tons a day. By the motion of the revolving muller, the pulp is drawn through its center and passes under it, between the grinding surfaces, to the circumference; from whence it passes again over the muller to the center, through the holes and between the grinding surface to the circumference as before. Thus a constant circulation of the pulp is kept up, bringing the particles of ore again and again under the muller, and reducing the whole mass to an impalpable powder.
No quicksilver lies between the surfaces to be ground, but at the circumference and center of the pan where the metal must pass through it as the pulp circulates.
A patent was granted for this Amalgamator in December last, and all persons are again warned against purchasing machines made at the Miners' Foundry, called "Wheeler's Amalgamator," as they are an infringement on my patent, and a suit is now pending in the U. S. Circuit Court against the parties infringing. My Amalgamator can be seen running at the Pacific Foundry, where all can judge of their operation and the very superior style in which they are being manufactured. THOMAS VARNEY.
sep21

PRATER'S
PATENT CONCENTRATOR.
The proprietors of this new Concentrator, having completed arrangements for its manufacture at the Pulpin Foundry, in this city, now offer it to the public, with the fullest confidence that for the purpose for which it is designed
It Has No Equal in Use.
The principle of this machine, which is designed for a Concentrator exclusively, is entirely new. It is designed for separating finely divided quicksilver, amalgam and gold from the sands, and for concentrating and saving the sulphurets, and is to be placed behind all or any other machine in use.
This machine is now running on waste sands, from which it is taking out an average of 2½ pounds of quicksilver for each ton of sand. Orders or letters of enquiry may be addressed to
HUNGERFORD & PRATER, Proprietors.
San Francisco, April 1st, 1864. 14v8-tf

Disney's Cylinder Amalgamator.
The Cheapest and Best.
Disney's Cylinder Amalgamator, which has recently been introduced to the public, has already been proved a complete success, and can be furnished, at a price cheaper than any other in use. It is simple in construction, and so arranged as to do a large amount of work with the smallest expenditure of power. The proprietor is satisfied that he can do more work in a given time and with a given expenditure of power than any other amalgamator in use. For small companies who desire cheap yet effective machines, none can be more desirable.
It may be seen in operation at the Rail Road Foundry on Fremont street where
A NEW CRUSHER
Is in operation and he can crush and Amalgamate at the LOWEST RATES. Miners and all others interested are invited to call and examine for themselves.
M. DISNEY, Patentee.
San Francisco, June 23, 1864. 1-3m

Annealing.

In a considerable number of instances, bodies which are capable of undergoing ignition, are rendered hard and brittle by sudden cooling. Glass, cast-iron and steel are the most remarkably affected by this circumstance: the inconveniences arising from which are obviated by cooling them very gradually, and this process is called "annealing." Glass vessels are carried into an oven over the great furnace called the leer, where they are permitted to cool, in a greater or less time, according to their thickness and bulk. Steel is most effectually annealed by making it red hot in a charcoal fire, which must completely cover it, and be allowed to go out of its own accord. Cast-iron, which may require to be annealed in too large a quantity to render the expense of charcoal very agreeable, may be heated in a cinder fire, which must completely envelope and defend the pieces from the air till they are cold. The fire need not be urged so as to produce more than a red heat; a little beyond this, bars and thin pieces would bend, if destitute of a solid support; and would even be melted without any vehement degree of heat. If it be required to anneal a number of pieces expeditiously, and the fire is not large enough to take more than one or two of them at once; or if it be thought hazardous to leave the fire to itself, from an apprehension that the heat might increase too much, the following scheme may be adopted: heat as many of the pieces at once as may be convenient, and as soon as they are red-hot bury them in the dry sawdust. Cast-iron, when annealed, is less liable to warp by a subsequent partial exposure to moderate degrees of heat than that which has not undergone this operation.

The above methods of annealing render cast-iron easy to work, but do not deprive it of its natural character. Cast-iron cutlery is, therefore, stratified with some substance containing oxygen, such as poor iron ores, free from sulphur, and kept in a state little short of fusion for twenty-four hours. It is then found to possess a considerable degree of malleability, and is not unfit for several sorts of nails and edge-tools.

Copper forms a remarkable exception to the general rule of annealing. This metal is actually made softer and more flexible by plunging it, when red-hot, into cold water, than by any other means. Gradually cooling produces a contrary effect.—*Mechanic's Own Book.*

Oil Springs of Humboldt County.—A correspondent of the *Union* says: Humboldt county is evidently destined to be one of the greatest oil-producing regions in the world; there is a large region of country here that seems to be completely saturated with petroleum; the liquid streams spontaneously through the surface and rises wherever a hole is dug, and coal gas arises everywhere. There is a large number of springs from which the natural crude oil flows in great abundance, one from which issues over a barrel per day; also, hundreds of gas springs, two of which are now burning. There are likewise two or three large pools of bitumen springs, or what is called asphalt. In fact, the oil-bearing sand rock seems charged from top to bottom with oil and gas. I entertain no doubt that the rocky strata, within the limits of several square miles, and more or less impregnated with the precious fluid.

Fossil Shells.—The *Flag* says that a number of quite unique fossil shells have recently been found embedded in argillaceous clay slate, in Bear Valley, Mariposa county, which are mainly interesting as being the first that have been found in the gold-bearing rocks on this coast. They were taken from the wall rock of the famous Pine Tree vein, in that valley. These shells, it is believed, are of marine origin, and of the cretaceous era. If so, they fix the relative age of our gold-bearing quartz veins—a subject of much interest to geological science. They are in the possession of Professor Blake, of this city, who will forward them to New York, for examination by the skilled paleontologists of that city.

The Washoe.—The wreck lies at the Third Street Wharf. On Friday, men were employed carrying out rubbish of all kinds from the hold. The stray relics of the terrible disaster, which could be seen scattered about, were such as to cause the most mournful thoughts and memories to steal over the mind. There were hats, and boots, little children's gaiters, ladies gaiters—some of them torn and stained by blood—torn undersleeves, balmoral skirts, rent into shreds, combs, etc. In the rubbish at the spot where the boilers lay, we picked up a fragment of a *femur* bone, about ten inches long, with pieces of flesh still adhering to it. It was placed in the barrow and buried in the bay with bricks and fragments of iron. What a charnel house is the hold of a steamer wrecked by such an explosion.—*Flag.*

Russia gets $20,000 of gold a year from the Ural mountains.

A Rich Church.—A Baptist writes thus of Dr. Todd's church in Pittsfield Mass.: "On Sabbath mornings, in pleasant weather, Dr. Todd preaches to 1,200 persons, completely filling the spacious house. There are the rich and the intelligent, the grave and the gay. Youth and beauty are mingled with dignity and age. The pecuniary value of that congregation, we are told, is seven millions of dollars, with a corresponding wealth of intelligence and refinement."

To Restore the color of the teeth, dissolve two ounces of borax in three pints of water, and before quite cold add thereto one teaspoonful of tincture of myrrh, and a tablespoonful of spirits of camphor. Bottle and mix for use. One wine glass of the solution, added to a half pint of tepid water, is sufficient for each application. This solution, applied daily, preserves and beautifies the teeth, extirpates tartarous adhesion, produces a pearl-like whiteness, arrests decay, and produces a healthy action in the gums.

Over-eating.—Dr. Hall says: As soon as you are sensible that you have eaten too much, take a walk, gradually increasing its rapidity until there is a free perspiration, and continue at this gait until every feeling of discomfort about the stomach or lungs has disappeared, then cool off very slowly in a closed room, and eat not an atom until the second meal thereafter, thus omitting one.

The Difference.—An exchange commenting upon the various generals that have become noted on both sides during the present war, argues that at the commencement we started out with our poorest generals and the rebels with their best; that every change we have made has been an improvement, and all their changes have placed poorer stock in command.

Preservation of Wood.—The following method is used in Germany for the preservation of wood. Mix forty parts of chalk, fifty of rosin, four of linseed oil, melting them together in an iron pot; then add one part of native oxyd of copper, and afterward, with care, one part of sulphuric acid. The mixture is applied while hot to the wood by means of a brush. When dry it forms a varnish as hard as a stone.

The Lucky Oil Men.—A number of individuals, who have lately become wealthy in oil borings, have purchased fine residences in Buffalo, and others are prospecting for such. The Cleaveland and Erie papers notice purchases of fine homesteads in those cities by the oil men. That barren and sterile region in Western Pennsylvania, so long neglected, promises to send out more millionaires than California with its gold mines.

Lincoln Bugs.—The Prairie du Chien (Illinois) *Courier* says there is a species of bug, about the size of a large bean, doing great damage to vegetation in that section. Whole acres of potatoes are entirely destroyed by this pest. They cover the vines, and destroy everything. These bugs have an "L" on their back, and the farmers call them "Lincoln Bugs." They were unknown before this season.

Quartz Mill for Idaho.—Messrs. Livingston & Hopkins, owners of the Fourth of July and Gambrinus ledges, Idaho, left per steamer Sierra Nevada, for Portland, on Tuesday, taking with them a very superior five-stamp mill, which will be taken through to Idaho direct, and will be set at work on their ledges very soon after its arrival. The mill was manufactured at the Miners' Foundry in this city.

Rhode Island Coal is now successfully used in part with Pennsylvania anthracite in the melting of copper metal and iron pig metal, and wholly in the generating of steam at the Sochanosset Facing Co.'s Works in Cranston. In the melting of iron it makes high soft iron soft; in other words, converts No. 3 iron back to No. 1 iron.

Copartnership Licenses.—The Commissioner of Internal Revenue has decided that under the proper construction of Sections 74 and 79 of the License Law, licenses cannot be granted for lawyers, conveyancers, claim agents, physicians, surgeons, dentists, cattle brokers, horse dealers and peddlers, in copartnership, but that each individual must pay a license fee and take a license for himself.

Fire.—Since Saturday last a terrible fire has been raging in the interior of Marin county, destroying timber and pasturage, and devastating the country generally. It originated on Wheeler's ranch, and spread over Creighton's, White's and other ranches, sweeping everything before it. A considerable number of logs were destroyed at Dixon's mill.

The streets in all the lower part of Charleston, S. C., are said to be knee-deep in grass.

TWELFTH YEAR OF PUBLICATION.

THE GOLDEN ERA,

Founded in 1852.

The oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, The Golden Era is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent, and correspondents of distinguished ability in New York, Paris and London.

The Golden Era is now enlarged by the addition of eight columns to its pages—and presents fifty six columns containing the greatest possible variety of Valuable and Entertaining, Original and Selected Matter, all combining to render The Golden Era a Literary and Family Journal of surpassing interest and attraction; a Welcome Guest in Cottage and Cabin; the favorite at the fireside in City and Country, the most useful, agreeable altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe, and elsewhere. Every Household in the Mountains and Valleys, the Cities, Towns, and Mining Camps of California and throughout the Pacific States and Territories, should receive and welcome The Golden Era as a regular weekly visitor.

"THE DOCTOR'S WIFE," now in course of publication in London, is universally pronounced to be Miss Braddon's greatest production. It will be completed in sixteen numbers of The Golden Era.

HUNT'S IMPROVED WIND-MILL.

THIS WIND-MILL IS RAPIDLY taking the place of all other Mills on the Pacific Coast. These Mills are so simple in their construction, that when once built, they can be put in order by almost any person; and when once in order they will run for years without repairs.

Prices, from $50 to $1,000.

ROUND AND SQUARE WATER TANKS BUILT TO ORDER.

HUNT'S PUMPS

Are admitted to be the best in the Market for Wind Mills, being built expressly for that purpose. They can be set, and taken apart with a common wrench, and are very easily repaired.

HUNT'S ENDLESS CHAIN

HORSE POWER

For Sawing Wood.

ALSO, THE

Self-Regulating Horse Power

Is so arranged as to give a steady motion, and is calculated to be used for turning Wood, Iron or Brass, also for Scroll or Circular Sawing, and is fully equal to Steam for any light work. The above Machines are built of the best materials, and made as Durable as Wood and Iron will make them.

ALL WORK WARRANTED.

☞ For further Particulars see small circulars. ☜

Worth Considering.—Advertising has proved the medium of success to many of the most prominent business men of the world. Merchants, Inventors, Builders, Patentees, Manufacturers, Foundrymen, Machinists, and, in fact, all who wish to call the particular attention of the Mining, Professional, Mechanical and Industrial members of the community to their business, should not fail to advertise in the Mining and Scientific Press. The circulation of the paper is extensive, and has a wide range, reaching the most intelligent readers in every mining settlement of importance on the coast. A large number of copies are also sent East. Our terms are reasonable. "Live and help live" we believe to be a sensible motto.

The *Mining and Scientific Press* makes its appearance upon an enlarged sheet. The *Press* is by far the best scientific paper ever published on the Pacific coast. Its contents exhibit both industry and ability. We wish it continued success.—*Washoe Herald.*

Scientific and Mining Journal.—This is as valuable a publication as is produced on the Pacific Coast, and one which interests all parties. It contains much that is instructive and entertaining, and seems to have the right men at the head of its affairs.—*Spirit of the Times.*

Mining and Scientific Press.—This well conducted journal has entered upon its ninth volume. It is a sterling periodical, and deserves encouragement.—*Territorial Enterprise*

IMPORTANT DISCOVERY

— IN THE —

Photographic Art.

Jacob Shew's

CHROMATIC PROCESS OF PRINTING PHOTOGRAPHS.

[PATENT APPLIED FOR.]

THE UNDERSIGNED WOULD ANNOUNCE TO THE public that he has discovered a new and IMPROVED PROCESS for printing Photographs, which produces a

SOFTNESS, CLEARNESS AND DELICACY OF TONE

unattainable by any other known process and to which he has given the above name. It is applicable to any size of Photograph, and those having valuable old negatives which they desire printed by the improved process can do so at any time.

In order to secure the pecuniary advantages to be derived from this important discovery a patent has been applied for. When obtained, the privileges of the right will be disposed of at a reasonable rate to any Photographer desiring it. In the meantime all are warned against encroachments upon the rights of the discoverer as such will be prosecuted to the full extent of the law.

"Cartes de Visite" and large Photographs printed by this process will be furnished at the prices of the ordinary work of other establishments.

A NEW IMPLEMENT.—We were shown yesterday morning, says the Virginia *Union* of the 6th instant, a new species of drill which if it prove to be a success for the purpose for which it is intended, is certainly of considerable importance to all concerned in mining operations. It is called "Linscott's Patent Chamber Drill," and intended for enlarging the cavity, or chamber, in the rock, for the powder, after the hole has been drilled in the usual manner. This instrument is some two and a half feet in length, made in the most substantial manner, of iron and steel, with a cutter two inches in length on each side, which, by means of springs, are made to shut themselves within the foot of the drill, and when it is struck on top in the usual manner with a sledge these cutters fly out and enlarge the chamber sideways, to the extent of three inches or more, according to the size of the instrument, and for six inches up and down; thus confining the powder in a more compact and effective body than has ever been done by any other process. The inventor is from Humboldt, where he says he has drilled many holes with it, making it work well in the hardest as well as the softest kinds of rock. May his invention prove a perfect success; for any improvement in mining implements, whereby the work of the miner may be facilitated and made more easy and effective, is certainly most earnestly to be desired. All who are in that line of business should give it a trial, and improve upon it if they can.

ADMIRAL Farragut's position during the engagement in Mobile harbor was in the maintop of his ship. He was lashed to the mast, in order to keep his position in case he was wounded. A speaking trumpet was run down to the deck, and an officer was stationed at the lower end to receive the Admiral's orders and pass them to the person whose duty it was to see them executed. The fleet pilot was also up in the rigging and from there gave his orders.

When it was reported to Admiral Farragut that the rebels had surrendered, and that Buchanan was wounded, he sent a staff officer off to receive the rebel Admiral's sword. Some one asked Farragut if he would not go off himself and see Buchanan. The former merely replied, "No, sir he is my enemy." Subsequently, when the staff officer returned with Buchanan's sword, it was represented to the Admiral that Buchanan had expressed a wish to see him. "Well, sir, he shall not see me," replied the old Salamander. Then looking about the bloody decks of his ship, he added, "I suppose he would be friends; but with these brave men, my comrades, mangled, dying and dead about me, and, looking upon the destruction he has caused in this fleet, I can only consider him an enemy."

G. F. DEETKEN,
MINING ENGINEER.

HAVING DISPOSED OF MY INTEREST IN THE DEETken & Co. Metallurgical Works, on the San Bruno Road, I offer my services to the Mining Community, to Superintend the starting of new Mills, to report upon Mines, and furnish correct Surveys and Maps thereof.

Drawings of Mining Machinery executed in the best style of the art. Small lots of Gold and Silver Ore Reduced carefully by the best known methods.

My old friends are respectfully invited to continue the patronage which I have enjoyed in this State the last ten years. Parties wishing to communicate, can do so through J. W. McKenzie, No 408 Montgomery street. 15-tf

Advertising Circular.

The Proprietors of the MINING AND SCIENTIFIC PRESS would call the especial attention of MINING SECRETARIES, TRUSTEES and SHAREHOLDERS, to a few substantial reasons for the publication of Mining Notices in their journal—the first and only important newspaper of its class published upon this coast.

1st. The PRESS enjoys a large and permanent subscription list, having a more universal circulation among shareholders and men intimately connected with mining interests than any other publication.

2d. Under the present law the publication of all mining notices on Saturday, in a weekly journal, complies as fully with the statutes as a daily publication. It is generally found to be equally as convenient for secretaries, and decidedly preferable to stockholders who have not time to examine throughout every issue of a daily.

3d. Economy in mining should always be looked upon with favor, and the cost for weekly advertising in the PRESS is less by one half than the rates of any other journal in this city possessing a respectable circulation.

4th. The publishers of the PRESS, making the mining interest their especial care, take particular pains to assist in the avoidance of errors in advertising. Our print is also more clear and perfect than can be expected in such papers as are hurriedly issued from cylinder presses.

5th. Our "Shareholders' Directory" forms a complete index of all mining notices published in San Francisco, by reference to which shareholders can at once see if their company is advertised, and determine whether the same is inserted in the PRESS or some other paper.

6th. Many copies of the PRESS are bound by prominent professional men, mechanics, secretaries, brokers, shareholders and others, as an important record for future reference, thereby rendering advertising, of every class, in its columns, of peculiar and permanent value.

7th. The benefit of having all mining notices consolidated in one newspaper, for the common convenience of shareholders, secretaries, and others who have occasion to refer to the same, is obvious. With this view we have established our rates at only fair, living prices, believing that a journal like ours, untrammeled by party, creed, or prejudice, is the only medium which can reasonably ask for such a consolidation of mining patronage.

8th. Our rates are uniform as well as moderate. Advertisements will be taken from the forms and printed on slips or as circulars, for sending personal notification to stockholders, whenever desired, at $1 per hundred.

9th. Advertisements in the columns of the PRESS, after their first insertion, are arranged alphabetically. Our present list is equalled only in one instance by that of any other journal. Shareholders, as well as strangers, naturally turn their attention to a mining journal for information concerning the mines and mining matters.

10th. Blanks for filling out advertisements of assessments or notices of sale are furnished gratis. Our rates of advertising, and any other information desired, will be freely given upon application at the office.

LAST, BUT NOT LEAST.—Our sheet (having been recently enlarged to the size of Harpers' Weekly) is now only equalled in its dimensions by one mining paper in existence—the *London Mining Journal*. Published in this, the greatest mining field of the world, we desire that the PRESS shall have no superior. We can only realize our cherished object of building up a reliable advocate of the science and business of mining, which will be of just honor and profit to our community, by experience and liberal patronage. The bestowal of such favors only as naturally belong to us, and which it is clearly for the benefit of the mining fraternity to extend, is all that is requisite, and we are confident we shall receive it.

DEWEY & CO.,

Publishers of the Mining and Scientific Press, Nos. 56 & 57 Government House, Corner of Washington and Sansome streets, San Francisco.

For Advertising Assessments on Saturdays.

Levy your Assessments upon any day EXCEPT FRIDAY.

Advertise the ASSESSMENT NOTICE on the FIRST FOUR SATURDAYS succeeding the day upon which the assessment is levied.

Appoint the day for advertising the DELINQUENT SALE on the FIFTH SATURDAY succeeding the date of levying the assessment.

Appoint the DAY OF SALE on the SEVENTH SATURDAY succeeding the date of levying the assessment, or any day *previous* to the Eighth Saturday.

Assessments ordered upon Saturday afford the Secretary the longest term in which to effect his advertising at the mine.

Extracts from the Statutes.

The attention of companies who desire advertising their delinquent sales in any other paper than that in which the notice of assessment appears, is called to the following section of the law approved April 4th, 1864:

Section 7. If any portion of the assessment mentioned in said notice shall remain unpaid on the day specified therein for the publication of the notice of sale, the Secretary shall, *unless otherwise ordered by the Board of Trustees*, cause to be published in the same papers in which the notice provided for in section five shall have been published, a notice substantially as follows, &c.

If, from a matter of convenience or necessity, the publication of an assessment is delayed, a very simple remedy is found in the following section of the law, relating thereto:

Section 14. No assessment duly levied shall be rendered invalid by a failure to make proper publication of the notices hereinbefore provided for, nor by the nonperformance of any act required to be performed in order to enforce the payment of the same; but in case of any substantial error or omission in the course of proceedings for collection, all previous proceedings, except the levying of the assessment, shall be void, and publication shall be begun anew.

Our Patent Agency.

The PATENT AGENCY of the MINING AND SCIENTIFIC PRESS has been signalized with remarkable success during the past two years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of LETTERS PATENT from the United States and foreign Governments cannot be over-rated, and the Proprietors of the PRESS, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

How to make your Remittances.—In most of the mining towns, bankers will furnish checks on San Francisco at par, (or at a very slight advance) to those who wish to pay us for subscriptions, advertising, mining blanks, etc. When it is more convenient, money may be remitted by mail at our risk if the parties sending will register their letters. Money sent by mail is seldom lost if properly enclosed. An excellent method is that of opening the layers of a card, placing the coins between the layers and sealing the edges together.

ENLARGEMENT.—The Mining and Scientific Press has again been enlarged by the addition of a fourth column to every page. It is conducted with ability and enterprise, and is meeting with the constantly increasing patronage which it deserves. There is a straightforwardness and fearlessness about it which we admire.—*S. F. Evangel.*

New This Week.

Caledonia Tunnel and Mining Company, Gold Hill District, Nevada Territory. Office, No. 8 & 10, Government House, corner Washington and Sansome streets, San Francisco.

Notice is hereby given that the Annual Meeting of the Stockholders of the Caledonia Tunnel and Mining Company, for the election of Trustees for the ensuing year, will be held at the office of the Secretary, on Monday, November 14th, 1864, at 2 o'clock P. M. of that day.

16-5 J. M. BUFFINGTON, Secretary.

Citizen's Coal Mining Company, Mount Diablo District, Contra Costa County, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 14th day of October, 1864, an Assessment (No. 10) of $5 per share was levied on the Capital Stock of said Company, payable on the 20th day of October, 1864, in United States gold coin to the Secretary, E. J. PFEIFFER, at the office of the Company, S. W. Corner Post and Dupont streets.

Any stock upon which said Assessment shall remain unpaid on Saturday, the 12th day of November, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday the 26th day of November, 1864, to pay the delinquent Assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

E. J. PFEIFFER, Secretary.

16-4t Office, S. W. Corner, Post and Dupont Sts.

Dualcl Webster Gold and Silver Mining Company, Sacramento District, Humboldt County, N. T.

And in accordance with law, and an order of the Board of Trustees, made on the 13th day of September, 1864, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of the company, No. 623 Montgomery street, San Francisco, on Tuesday, the 1st day of November, 1864, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

GEO. A. HILL, Secretary,

Office, No. 623 Montgomery Street, San Francisco, Cal. 16

[The mining community begin to appreciate our reasonable rates of advertising, and are turning their patronage to the journal most properly entitled to receive it. The advantage to shareholders of having all mining notices concentrated in one mining journal, is obvious to all, and our terms have been established with a view to effect such a consolidation; and most companies having an object for publishing in any other particular paper, can consequently afford to have their notices appear in our journal also.—EDS. PRESS.]

THE KOOTENAI MINES.—MINES ON THE JEFFERSON FORK OF THE MISSOURI.—The Walla Walla (W. T.) *Statesman* of 30th September has the following items:

Intelligence from Fisherville, in the Kootenai district, furnishes a brief account of the doings of a redoubtable son of one "Johnny Bull," in the person of Commissioner Haines, who arrived in the mines on the 15th of August. The presence of her Majesty's servant in the mines seems to have created somewhat of a stir among such of the boys as had preconceived ideas of the policy he would pursue in carrying out the laws of British Columbia; this, however, soon gave place to order and quietude. British authority is being exercised over the Fisherville district. Each miner is allowed 200 feet square, and is taxed $5 quarterly for a license to mine, $2.50 of which goes to the Recorder for entering it. A tax of $1 is levied on each animal arriving from this side; for each aparajo, $1.50; for liquor, per gallon, $1.50; for all other commodities, 10 per cent. There is any quantity of mining implements and simple goods in the mines, making prices at comparatively low figures: Flour, 85c. per pound; sugar, from 50 to 60c.; bacon, 60 to 70c. Vegetables were being brought in from the Colville and Walla Walla valleys in great quantities. Onions were worth from 25 to 35c. per pound; fresh beef, 80c.; butter, $1.50; eggs, from $1 to $1.25 per dozen.

A returned miner from the eastern slope of the mountains gives it as his opinion that as good mines as have been found anywhere are on Alder Gulch in the Stinking-water district. This is a branch of the Jefferson Fork of the Missouri river. The mines extend some 15 miles, and are said to be very rich; one day three persons cleaned up about $2,500. The average pay was $25 to $30 per day to the hand; $6 per day was the ruling price for laborers, and as high as $10 for good drifters.

A NEW NAIL MACHINE.—A new nail-making machine—called "Wickersham's"—is being introduced, which promises to work a revolution in that line of business. Three million kegs of nails are now, it is said, yearly manufactured in the United States. Instead of manufacturing one nail at a time, as is done by the machinery now in use, this machine can cut from a twenty-inch iron plate, eighty-two and a half (eight-penny) nails at one blow, and can make four blows per second, thus giving thirty-two nails, headed and pointed, in a second. The same machine will make one hundred and sixty half-inch brads per second—forty at a time, or about thirty-six hundred pounds per day, including all sizes of finishing nails, at a profit of at least four cents per pound. By the old method but one nail at a time is cut. The cost of cutting by this new machine is not over one-tenth that of any other method. Two machines, employing one hand, can make one hundred kegs of eight-penny nails per day. By the old method, two machines, employing two hands, make from two to eight kegs per day, according to the skill of the workmen. One of the large factories with fifty machines produces fifty thousand kegs of nails per annum. Fifty Wickersham machines will make seven hundred and fifty thousand kegs per annum! The nails made are better pointed, too, than by the old method, and have a much greater holding power.

A SURGICAL OPERATION UPON A LION.—A Brussels journal gives an account of a curious surgical operation just performed on the great African lion belonging to the Zoological Society of that city. For some time past the animal has been suffering from disease in the feet, which necessitated the cutting of its claws. In order to do this without danger, a large box was prepared with a grated bottom, covered by a wooden floor, which could be withdrawn, so as to allow the lion's feet to pass between the bars. The top of the box was also made to descend by means of screws so as to press on the animal and prevent it from drawing in its feet. When the lion had entered the box, the latter was turned on its side and the sliding bottom withdrawn. The paws then slipped between the bars and the screws above were tightened. M. Thiemasse, assisted by five pupils of the Veterinary School, then proceeded to cut away the claws. The patient bore the operation tolerably well, only uttering a short roar occasionally, and seemed relieved when the first paw had been cut and dressed. A keeper, to whom the lion is much attached, sat near its head and endeavored to calm it by talking, evidently not without effect. The operation was successfully performed, and there is every reason to believe that the cure will be complete.

PETROLEUM REFINERIES AT PITTSBURG.—The whole number of petroleum refineries at Pittsburg is fifty-eight, with a total capacity per week of 26,000 barrels. Value of real estate, buildings and machinery, $2,534,000; value of oils refined, $8,599,323; wages paid per annum, $350,000.

Owen's River Canal Company.

CAPITAL STOCK.....$1,000,000

10,000 Shares.....$100 per Share.

POSTPONEMENT.—The above sale is postponed until Saturday November 5th, 1864. 11

Putnam's Clothes Wringer.

IT IS THE ONLY RELIABLE SELF-ADJUSTING WRINGer. No wood work to swell or split. No thumb-screws to get out of order. Warranted with or without cog-wheels. It took the FIRST PREMIUM at Fifty-Seven State and County Fairs in 1863, and is WITHOUT AN EXCEPTION the best Wringer ever made. Patented in the United States, England, Canada and Australia. Agents wanted in every town, and in all parts of the world. Energetic agents can make from three to ten dollars per day. Sample Wringer sent Express-paid on receipt of price. No. 2, $6.50. No. 1. $7.50. No. F. $8.50. No. A. $9.50. Manufactured and sold, wholesale and retail, by

THE PUTNAM MANUFACTURING CO.,

No 13 Platt Street, New York, Cleveland, Ohio and Bennington, Vt. S. C. NORTHROP, Agent.

What Everybody Knows,

Viz: That Iron well galvanized WILL NOT RUST; That a simple machine is better than a complicated one; That a Wringer should be self-adjusting, durable and efficient; That Thumb-Screws and Fastenings cause delay and trouble to regulate and keep in order; That wood soaked in hot water will swell, shrink and split; That wood bearings for the shaft to run in will wear out; That the Putnam Wringer, with or without cog-wheels, will not tear the clothes; That cog-wheel regulators are not essential; That the Putnam Wringer has ALL the advantages, and not one of the disadvantages above named; That all who have tested it, pronounce it the best Wringer ever made; That it will wring a Thread or a Bed-Quilt without alteration.

We might fill the paper with testimonials, but insert only a few to convince the skeptical, if such there be; and we say to all, TEST Putnam's Wringer. Test it THOROUGHLY with any and all others, and if not entirely satisfactory, return it.

Putnam Manufacturing Co:—

GENTLEMEN. I know from practical experience that iron well galvanized with zinc will not oxydize or rust one particle. The Putnam Wringer is as near perfect as possible, and I can cheerfully recommend it to be the best in use.

Respectfully yours,
JNO. W. WHEELER, Cleveland, Ohio.

Many years experience in the galvanizing business enables me to endorse the above statements in all particulars.
New York, Jan., 1864. JNO. C. LEFFERTS.
No. 100 Beekman St.

We have tested Putnam's Clothes Wringer by practical working, and know that it will do. It is cheap; it is simple; it requires no room, whether at work or at rest; a child can operate it. It does its duty thoroughly; it saves time and it saves wear and tear. We earnestly advise all who have much washing to do, with all intelligent persons who have any, to buy this Wringer. It will pay for itself in a year at most. HON. HORACE GREELEY.

READY ROOFING

READY TO NAIL DOWN.

READY ROOFING

At less than half the cost of tin roofs.

READY ROOFING

More durable than Tin.

READY ROOFING

Suitable for steep or flat roofs.

READY ROOFING

For all kinds of buildings, in all climates.

READY ROOFING

Easily, cheaply, and quickly put on. Needs no coating over with cement after it is nailed down.

READY ROOFING

Made of a strong woven fabric, thoroughly saturated and covered upon both surfaces with a perfectly water-proof composition, and put up in rolls ready for use—40 inch wide, and 75 feet long.

WE ALSO MANUFACTURE
Liquid Cement,
FOR LEAKY TIN ROOFS.

Much cheaper and more durable than oil paint. Also,

Compound Cement,
For Leaky Shingle Roofs,

Which will often save the cost of a new roof.

Samplesses of Ready Roofing and Circulars sent by mail when desired. Favorable terms made with responsible parties who buy to sell again.

READY ROOFING CO.,
6tf 73 Maiden Lane, N. Y.

Important to Secretaries.

Secretaries will please write proper names and figures distinctly, and hand in their advertisements as early in the week as practicable. Our latest forms go to press Friday evening. Any information concerning the requirements of the laws regarding advertisements will be cheerfully given when solicited. Inspect all your notices carefully upon their first appearance. In case of postponement, give the earliest notice possible at the office. When copy is received sufficiently early, a proof-sheet will be furnished if desired. A revised copy rendered, for advertising at the mine, when requested. Neatly printed copies of advertisements, for serving individual notice to stockholders, printed at $1 per hundred. Copies of the new advertising law, as officially published, furnished gratuitously. ☞ Blank forms, for filling out Assessment Notices and Delinquent Sales, supplied free to advertisers in the MINING AND SCIENTIFIC PRESS on application at the office

Bound Copies for Sale.—Bound copies of Volume VIII, complete, of the MINING AND SCIENTIFIC PRESS, from January 1st to July 1st, can be procured on application to the office.

For Sending East, no more valuable or appropriate publication can be selected than the MINING AND SCIENTIFIC PRESS. For sale by the principal news agents.

Mining Notices.

Advertised in Previous Issues.

Aspinwall Gold and Silver Mining Company, Amador District, Lander County, N. T.

CAUTION.—The public are hereby cautioned against negotiating for the following described Certificates of Stock of the above named company, as the same were sold for delinquent assessments, on the 13th day of August 1864, and will not be transferred on the books of the company, to wit:

Certificates No. 80, 81, 82 and 83, standing in the name of B. T. Hunt. Certificates No. 71, 72, 73, 74, 75, 76 and 77, standing in the name of W. D. Mathenay.

11 JOSEPH HEALY, Secretary.

Buckeye and Old Hickory Consolidated Gold, Silver and Lead Mining Company—Location, Santa Catalina Island, Los Angeles County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 3d day of September, 1864, an assessment (No. 7) of 50 cents per share was levied upon the capital stock of said Company, payable on the 10th day of September, 1864, in United States gold or silver coin, to the Secretary, at his office, No. 324 Clay street, San Francisco, or to J. K. PHILLIPS at the mine.

Any stock upon which said assessment shall remain unpaid on Saturday the 15th day of October, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold, on Thursday the 3d day of November, 1864, at 12 o'clock, to pay the delinquent assessment thereon, together with costs of advertising and the expenses of the sale. By order of the Board of Trustees

B. C. AUSTIN, Secretary.

Office, 324 Clay street, San Francisco. 11-4

POSTPONEMENT.—The advertisement of stock delinquent on the above assessment is hereby postponed until Friday, October 28th, 1864, and the sale thereof until Saturday, November 12th, 1864. By order of the Board of Trustees, made on the 13th day of October, 1864.

16 B. C. AUSTIN, Secretary.

Crown Point Ravine Gold and Silver Mining Company, Gold Hill District, Storey County, Territory of Nevada; office, corner of Washington and Sansome streets San Francisco, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 28th day of September, 1864, an assessment of five dollars per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary at his office, or to JAS. B. COFFEY, Virginia City, Nevada Territory.

Any stock upon which said assessment shall remain unpaid on the 1st day of November, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on the 16th day of November, 1864, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

And in accordance with law and an order of the Board of Trustees, made on the 22d day of August, 1864, so many shares of each parcel of said stock as may be necessary, will be sold at the salesroom of Cobb & Sinton, 406 Montgomery street, San Francisco, on Monday, October 10th, 1864, at one o'clock, P. M. of said day, to pay said delinquent Assessment thereon, together with costs of advertising and expenses of the sale, unless previously paid.

J. A. RAWSON, Secretary.
Office, No. 338 Monigomery street.
September, 30th 1864. 14-2t

POSTPONEMENT.—The above sale is hereby postponed until Thursday, the 20th day of October, 1864, at the same place and hour. By order of the Board of Trustees.

15 4 J. A. RAWSON, Secretary.

Table Mountain Copper Mining Company, Stan- islaus District, Calaveras County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 19th day of September, 1864, an Assessment (No. 6) of one dollar and sixty-five cents per share was levied upon the Capital Stock of said Company, payable immediately, in United States gold coin, to the Secretary, or to J. M. PIKE, Superintendent, Copperopolis.

Any stock upon which said Assessment shall remain unpaid on Saturday, the 22d day of October, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Monday, the 7th day of November, 1864, to pay the delinquent Assessment, together with the costs of Advertising and expenses of the sale.

Ordered that a deduction of Fifteen Cents per share be allowed on all payments made before September 29th, 1864 By order of the Board of Trustees.

M. G. ELMORE, Secretary
Office, No. 621 Clay street.
San Francisco, September 19th, 1864. 13-4t

United States Mining Company, Virginia Dis- trict, Nevada Territory.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 30th day of September, 1864, an assessment of one dollar per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary, at his office, or to J. B. COFFEY, Virginia, Nevada Territory

Any stock upon which said Assessment shall remain unpaid on Monday the 31st day of October, 1864, will be advertised on that day as delinquent, and, unless payment shall be made before, will be sold on Wednesday the 16th day of November, 1864, at 12 o'clock M., to pay the delinquent assesment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

J. M. BUFFINGTON, Secretary.
Office, Rooms No. 8 & 10 Government House, corner of Sansome and Washington sts., San Francisco, Cal. 14

Our Circulation.—THE MINING AND SCIENTIFIC PRESS has a large and permanent subscription list, and enjoys a more universal circulation among stockholders and persons directly interested in mining than any other paper on this coast.

ENLARGED.—The *Mining and Scientific Press*, of San Francisco, commenced its ninth volume to-day in an enlarged form. This valuable journal has been deservedly successful, and should have a large circulation among the mining community.—*Alpine Chronicle.*

EXPANDING THE LUNGS.—Step out into the purest air you can find; stand perfectly erect, with the head and shoulders back, and then fixing the lips as though you were going to whistle, draw the air through the nostrils into the lungs. When the chest is about full, raise the arms, keeping them extended, with the palms of the hand down, as you suck in the air, so as to bring them over the head, just as the lungs are quite full. Then drop the thumbs inward, and after gently forcing the arms backward, and the chest open, reverse the process by which you draw your breath, till the lungs are entirely empty. This process should be repented three or four times during the day. It is impossible to describe to one who has never tried it the glorious sense of vigor which follows the exercise. It is the best expectorant in the world. We know a gentleman the measure of whose chest has been increased some three inches during as many months.

NEW INFLAMMABLE GAS.—It is stated that during some experiments made some time ago by M. M. Bluff and Wohler, upon electrotypic decomposition, they employed a plate of the metal aluminum as the negative terminal of the battery for the decomposition of water, and as soon as the electric current was established they were surprised to find that instead of pure hydrogen gas being involved, as is usual with a platinum plate, a gas was evolved, which inflamed spontaneously. Upon investigation, this gas was found to be composed of hydrogen and silicon, the latter being an impurity in the aluminum plate. Several processes have recently been adopted for preparing this gas. Silicated hydrogen and the silicate of magnesia are found to furnish the best materials for producing it.

MINING ACCIDENTS IN GREAT BRITAIN.—In 1863 there were 907 deaths caused by accidents in and about the mines of Great Britain, 226 less than in 1863. 163 of the deaths were caused by the explosions of fire-damp, 407 by falls in mines, 147 by accidents in shafts, 134 by miscellaneous underground accidents, and 56 by accidents at the surface. There were also in 1863, 91 deaths caused by accidents in and about the inspected ironstone mines of Great Britain, 14 less than in 1862. In South Wales, one life was lost to every 45,390 tons of coal raised, and that has been about the average of the last eight years. In Scotland the deaths are as low as six per 100,000 tons raised.

TORN BY A GRIZZLY.—Thomas Smith, who resides on the Pajaro river, was terribly torn by a grizzly, while out hunting, on Friday of last week. He fired upon the animal, which turned upon him and caught him by the heel as he was endeavoring to climb a tree, and pulled him down. After severely biting and tearing Mr. Smith, the animal went off some fifty feet, hut returned and again hit him about the shoulder and arm, and then departed. Mr. Smith was found in this mangled condition by his companions, who took him to his residence, where he is now undergoing medical treatment.

RED Sealing Wax of good quality is made by carefully fusing a mixture of 48 parts of shellac, 19 of Venice turpentine, and one of Peru balsam, to which 32 parts of finely levigated cinnabar and some sulphate of lime are afterwards added. In the cheaper kinds red lead is substituted for the vermillion, and there is much common rosin, which causes the wax to run into thin drops when melted. Black sealing wax is made of 60 parts of shellac, 10 of Venice turpentine, and 8 of finely levigated ivory-black.

A NEW PROJECTILE.—A British officer has made what the English speak of as a valuable discovery in artillery. It is termed "chilled shot," i. e., shot cast in cold sand moulds instead of hot iron ones. These projectiles, large enough for 100-pounders, pass through the target solid, and then split into minute fragments of four or eight ounces, dealing death around like shell. They cost, moreover, two shillings instead of fifty shillings, English money.

ISTHMUS OF SUEZ.—The canal, which has for some time been in construction, from Ismailia to Port Said, has been completed, and fresh water is now furnished across the line of the desert, as well as at this important port.

A BEAUTIFUL IDEA.—An Indian philosopher being asked what were, according to his opinion, the two most beautiful things of the universe, answered: "The starry heavens above our heads, and the feeling of duty in our hearts."

THE disbursements of the Federal Government on the Pacific Coast, for the four years ending August 31st, amount to $13,418,892.

THE great Sanitary Cheese was forwarded to New York by the steamer Constitution which sailed Thursday.

Mining and Scientific Press Patent Agency.

SAN FRANCISCO.

Information About Obtaining Patents.

The Patent Law Amendment Act, of March 4th, 1861, and March 3d, 1863, now in force, introduces several important changes in our Patent System. The general practice of the Patent Office, however, in regard to the examination and issue of Letters Patent for new inventions, remains nearly the same as heretofore.

The amendment of 3d March, 1863, provides, in section 3, that every patent shall be dated as of a day not later than six months after the time at which it was passed and allowed, and notice thereof sent to the applicant or his agent. And if the final fee for such patent be not paid within the said six months, the patent shall be withheld, and the invention therein described shall become public property as against the applicant therefor: *Provided*, That in all cases where patents have been allowed previous to the passage of this act, the said six months shall be reckoned from the date of such passage.

The first question, therefore, that presents itself to the inventor, who desires to procure a patent, is: "Can I obtain a patent?" A positive answer to this question is only to be had by presenting a formal application for a patent to the Government, embracing a petition, specification, model, duplicate, drawings, and the payment of the prescribed official fees. Aside from these steps, all the inventor can do is, to submit his plans to persons experienced in the business of obtaining patents, and solicit their opinion and advice. If the parties consulted are honorable men, the inventor may safely confide his ideas to them, and they will inform him whether or not his invention is probably patentable.

Those who have made inventions and desire to consult with us respecting the same, are cordially invited to do so. We shall be happy to see them in person at our office, or to advise them by mail, or through the MINING AND SCIENTIFIC PRESS. In all cases they may expect from us an honest opinion. For these consultations, opinion and advice, we make no charge. A pen-and-ink sketch, and description of the invention should be sent, together with a stamp for return postage. Write plain; do not use pencil or pale ink; be brief.

Remember that all business committed to our care, and all consultations, are kept by us secret, and strictly confidential.

Preliminary Examinations.

In some cases it may be advisable as a measure of prudence to order a preliminary examination. This consists of a special search made at the U. S. Patent Office, Washington, through the medium of our associate in that city, to ascertain whether among all the models and records there stored, any invention can be found which is similar in character to that of the applicant. On the completion of this special search we send a written report to the party concerned, with suitable advice. Our charge for this service, including the report, is ten dollars. This search, although it involves the expense just named, will usually prove satisfactory. If the same device has been before patented, the time and expense of constructing models, preparing documents, etc., will in most cases be saved; if the invention has been in part patented, the applicant will be enable to modify his claims and expectations accordingly. Many other obvious advantages attending the Preliminary Examination; although the strictest search does not always enable the applicant to know positively whether a patent can be had. Applications for patents are often rejected because the Examining officer finds a description of the alleged invention in some foreign publication; or some other person has been previously rejected on an analogous device; or some other invention for a similar purpose, but partially resembles the applicant's in its construction; or the Government makes an unjust or uncommon decision. Against none of these contingencies does the Preliminary Examination provide; it will, however, generally inform the applicant whether an improvement similar to his and sought for the same purpose has ever been patented or not in this country.

Persons desiring the Preliminary examination are requested to remit the fee ($10), and furnish us with a sketch and description of the invention.

Caveats.

A Caveat is a confidential communication made to the Patent Office, and is therefore filed within its secret archives. The privilege secured under it entitles the party filing the caveator to receive notice, for a period of one year, of any application for a patent subsequently filed, and which is adjudged to be novel, and is likely to interfere with the invention described in the caveat, and the caveator is then required to complete his application for a patent within three months from the date of said notice. Caveat papers should be very carefully prepared. Our fee for the service varies from $10 to $20. The Government fee under the new law is reduced to ten dollars; and this sum does not apply, as heretofore, as part of the fee on presenting an application for a patent.

Inventors will oftimes find it very important to take advantage of the caveat system—the expense under the law being comparatively small.

To enable us to prepare caveat paper, we only require a sketch and description of the invention; no model being necessary.

Expense of Applying for a Patent, Rejections, etc.

Under the new law, the Government fee, on filing an application for a patent, is fifteen dollars; and if the patent is allowed, twenty dollars additional is required. If rejected, the first fee of fifteen dollars is all that is demanded. English, French, Austrian, Prussian Spanish, and inventors of every nationality, may now obtain patents in the United States upon the same terms as our own citizens. The only discrimination made is against subjects of government that discriminate against the inhabitants of the United States.

To the foregoing official fees must be added the Attorney's fees for preparing the various documents and drawings. Our charge for preparing a case, presenting it to the Government, and attending to all business connected with it, until a decision is given, is from $20 to $40. If the patent is granted no further agency expenses ensues. If the application is rejected we cause a thorough investigation to be made into the reasons presented to the Commissioner for refusing the patent. In making this examination, we have excess to all the drawings, models, books and specifications cited in reference, and we report the result as early as possible to our client. For this service we make no charge. If the rejection proves to be an unjust one—which sometimes happens—it can generally be reversed, and the patent obtained by contesting the case. For this prosecution we charge a fee proportionate to the amount of labor involved, payable only on the issue of the patent; but our demand will be reasonable and satisfactory to our clients, and will be arranged beforehand by special agreement.

The system adopted by us works well, gives general satisfaction and presents to all applicants, rich or poor, an equal opportunity of procuring their patent rights prepared, conducted and prosecuted in the best manner, by experienced attorney's, upon the most moderate terms. Inventors who have rejected cases, prepared either by themselves, or for them by other agents, and desire to ascertain their prospects of success before further efforts, are invited to avail themselves of our unequalled facilities in securing favorable results. We have been successful in securing Letters Patent in many cases of such a matter. Our terms for such cases are very moderate.

Models, Remittances, etc.

The law requires that the inventor shall, in all cases, furnish a model, which must not exceed twelve inches in any of its dimentions; it should be neatly made, of hard wood or metal, or both, varnished or painted; the name of the inventor should be engraved or painted on it conspicuously.

When the invention consists of an improvement on some known machine, a full working model of the whole will not be necessary. It should be sufficiently perfect, however, to show, with clearness, the nature and operation of the invention.

As soon as the model is ready, it should be carefully boxed and shipped by express or otherwise, to our address, namely: DEWEY & Co., Mining and Scientific Press, rooms 56 and 57, Government House, corner of Sansome and Washington Streets, San Francisco, Cal. Prepay expenses and send express receipt to us by mail.

Simultaneously with the model, the inventor should send us the first instalment of the Government fee, fifteen dollars. The money may be forwarded either by express with the model, or by mail. The safest way to remit is by draft on San Francisco, payable to our order. Always send a letter with the model, and also the remittance stating the name and address of the sender.

A full description should also be sent with the model, embodying all the ideas of the inventor respecting the improvement.

On the receipt of the model and Government fee, the case is duly registered upon our books, and the application proceeded with as fast as possible. When the documents are ready we send them to the inventor by mail, for his examination, signature and affidavit, with a letter of instruction, etc. Our fee for preparing the case is then due and will be called for. The case will then be presented to the Patent Office, and as soon as the patent is ordered to be issued the Government fee, namely, twenty dollars.

Inventors who do business with us will be notified of the status of their application in the Patent Office, when it is possible for us to do so. We do not require the personal attendance of the inventor, unless it is one of great complication the business can be well done by correspondence.

When the invention consists of a new article of manufacture, or a new composition, samples of the separate ingredients, sufficient to make the experiment, and also of the manufactured article itself must be furnished.

The average time required to procure a patent, when the case is conducted at our agency, is three months. We frequently get them through in less time; but in other cases, owing to delay on the part of officials, the period is sometimes extended to four or five months, and even more. We make a special point to forward our cases as rapidly as possible.

Return of Models.

Under the new law, if the applicant's case has been rejected he is entitled to withdraw his model from the Patent Office.

This law applies to all past rejected cases, and if parties wish to obtain their models through us, they can do so at a small expense.

Application for Patents, Designs, Trade-Marks, Labels, etc.

Under the new law patents may be taken out for any new form of any article, also for tools, patterns, castings, machine-frames, stove-plates, borders, fringes, all new designs for printing, weaving or stamping upon silks, calicoes, carpets, oil-cloth, prints, paper-hangings, and other articles. Trade-marks, labels, envelopes, boxes and bottles for goods, may also be patented; likewise all works of art, including prints, paintings, busts, statues, bas-relief, or compositions in alto, or basso relievo, new dies, impressions, ornaments to be placed upon any article of manufacture, architectural work, etc.

Our facilities for the prompt preparation and securing of patents are of the most thorough character and our charges are very moderate.

Patent Office Fees, and How Payable.

Nearly all the fees payable to the Patent Office are positively required by law to be paid in advance. For the sake of uniformity and convenience, the remaining fees will be required to be paid in the same manner; that is to say, before the labor is performed for which they are to be received in payment.

The following is the tariff of fees established by law:

On every application for a design, for 3 y'rs and 6 mos...	$10
On every application for a design, for seven years.....	15
On every application for a design, for fourteen years.....	30
On every caveat.....	10
On every application for a patent.....	15
On issuing each original patent.....	20
On filing a disclaimer.....	10
On every application for a re-issue.....	30
On every additional patent granted on a re-issue.....	30
On every application for an extension.....	50
On the grant of every extension.....	50
On appeal to the Commissioner from Examiners-in-chief	20
On every appeal to the Judges of Circuit Court, D. C....	25

Infringements.

The manufacture, sale, or use of a patented article, without consent of the owner of the patent, is an infringement, and subjects the infringer, by injunc tion from the Court, to the arrest of or prohibition from the employment of his machinery, shop, works, factory and men in production of the article.

In addition to injunction the infringer is liable to be mulcted in treble the amount of damages awarded by the jury. The maker, the workman, the seller, and the purchaser, if a user, are all liable either collectively or individually.

Having access to all the patents, models, public records, drawings and other documents pertaining to the Patent Office, we are prepared to make examinations and give opinions upon all infringement questions, advise as to the scope and ground covered by patents, and direct with vigor any legal proceedings therewith connected. Our charge will be moderate, and proportionate to the labor involved.

Appeals.

In rejected and other cases, the new law provides for an appeal from the Examiner-in-chief to the Commissioner in person, on the payment of a fee of twenty dollars. A further appeal may be taken from the decision of the Commissioner to the U. S. Court, of the District of Columbia. These appeals are heard by any of the Judges before whom the applicant elects to bring the case. No Jury. All the papers, models, etc., are sent by the Commissioner to the Judge, who then reviews the case, and either sustains or reverses the Commissioner's decision.

The party taking the appeal pays an additional fee of twenty-five dollars. The Judge appoints a day of hearing. The applicant can appear in person or by counsel to state his case and file a written argument. Five days are allowed the opponent to put in an answer, and a similar period to the appellant for a closing reply.

Many important cases are brought before the Judges on appeal and the decisions of the Commissioner are not unfrequently reversed.

We have had successful experience in conducting these appeals and our services are rendered on moderate terms.

DEWEY & CO., Agents,
Mining and Scientific Press Office, Government House, corner Sansome and Washington streets, San Francisco.

A MAGNIFICENT
LITHOGRAPHIC VIEW
OF THE
Mechanics' Fair Pavilion.
PUBLISHED AND SOLD BY
DEWEY & CO.,
GEORGE H. BAKER, Artist.

At the office of the "Mechanics' Fair Daily Press," entrance nave of the Pavilion, and at the office of the Mining and Scientific Press, corner of Washington & Sansome streets.

☞ *READ WHAT OTHERS SAY OF IT.* ☜

MECHANICS' FAIR PAVILION.—We have received from Dewey & Co., Patent Agents and publishers of the SCIENTIFIC PRESS, Government House, corner of Washington and Sansome streets, a finely executed lithographic view of the Mechanics' Industrial Fair Pavilion, on Union Square. The picture is mathematically correct in proportion, and will be valuable hereafter as a souvenir of the greatest industrial exhibition ever held in our city.—"Daily Alta."

We are indebted to the publishers of the MINING AND SCIENTIFIC PRESS for a copy of a very excellent engraving they have issued of the Fair building and the Fair grounds.—CALIFORNIAN.

LITHOGRAPHED.—The Mechanics' Fair building has been pictured in good style, by George H. Baker. We acknowledge the receipt of a copy. DEWEY & Co. are the publishers.—CALL.

VIEW OF THE MECHANICS' INSTITUTE PAVILION.—MESSRS. DEWEY & Co. have published a lithographic view of this building. Size, 12 by 19 inches. The workmanship does credit to Geo. H. Baker, the Lithographer. The dimensions of the Pavilion are 375 feet in length, breadth 220 feet; dome 108 feet high and 100 feet diameter, the area being 55,000 square feet. P. J. O'Connor Esq., is the Architect. We hope the sheet will prove highly remunerative.—ARGUS.

MINING COMPANIES and others connected with the Mining Interests of California, will find all possible desired information in the *Mining and Scientific Press* of San Francisco, which is an ably edited Journal, smartly handled, and well up to the times. The Mining Companies of California, are awake to the advantages of having their Mining Notices, comprising Assessments, Dividends, Elections, &c., concentrated in the advertising columns of one Journal, as we notice in the issue of the *Press* of May 7th, there are no less than seven pages of this interesting matter.—*U. S. Mining Journal, Railroad and Financial Advertiser, New York.*

NEW VOLUME.—The *Mining and Scientific Press*, published at San Francisco, has entered upon its fifth year of existence. It has been enlarged to a sixteen page paper, and is flourishing like a green bay tree. (We don't insinuate that it wicked.)—*Red Bluff Independent.*

BRANDRETH'S PILLS.

This Medicine often Cures when all others have failed. They prevent Apoplexy; they Cure Diseases of the Heart and Nervous Diseases, and as a

Purgative and Billious Pill,

They have not their equal in the World. Employed according to directions, accompanying every box of new style, they produce

Great Purity of the Blood and the System Generally,

Causing only the removal of vitiated matters which have become useless or injurious, and securing in the reconstruction of diseased parts of nothing but sound and healthy materials.

TO QUARTZ MINERS.

Hinkle's Centrifugal Pulverizer and Amalgamator!

THE ATTENTION OF MINERS IS RESPECTFULLY requested to HINKLE'S CENTRIFUGAL PULVERIZER AND AMALGAMATOR, now manufactured and to be seen in operation at the NOVELTY IRON WORKS of Mr. E. T. Steen, Nos. 37 & 39 Fremont street, between Market and Mission streets.

This machine is the best in the State for the purpose of Pulverizing and Amalgamating ORES. The whole machine, made entirely of iron, will not exceed One Ton, and no piece of it will exceed 200 pounds, which makes it very convenient for transportation to remote districts. It will work Two Tons of Rock per day.

Mr. Hanson, who is running one of the machines, is an experienced Amalgamator, and will receive Ores at the above named place, and extract the metals and furnish assays for all persons wishing the same. The Subscriber is also perfecting a HAND MACHINE for Miners engaged in prospecting, which will work 25 pounds of ROCK at a time, and which will weigh about 125 pounds.

The Pulverizer and Amalgamator works Rock of the size of a grain of corn to an impalpable powder. Apply to
PHILIP HINKLE,
At the Novelty Iron Works, Nos. 37 & 39 Fremont street.

SALMON'S
PROPELLER AMALGAMATOR.

The proprietors and inventors of this machine, after fourteen years of practical experience in mining in California and Nevada Territory, and having a thorough knowledge of the wants of Miners and Mill men, have succeeded in making an Amalgamator, which, for the purposes intended, far surpasses any other yet presented to the public, and which can be furnished at less than one-half of the expense of any other Amalgamator, now in use, besides requiring less labor to clean and keep it in running order. The Amalgamator is simple in its construction, consisting of a pan or tub constructed of wood and adapted to either a Stone or Iron bottom. Opposite ends other, and on the inside of the tub, are two flanges, from two to four inches broad, reaching from the top to near the bottom, with room for the mullers to pass under. These flanges are for the purpose of preventing the pulp from forming a circular current, and together with a number of wings placed like a screw propeller on the muller-shaft, force a current centrally on the quicksilver at the bottom and under the grinding surface of the mullers. This peculiarity of propeller-screw and side wings, in combination with a deep tub, are what the proprietors claim as new and for which a patent has been applied for. The Inventors of this machine are practical Mechanics as well as experienced miners, and the machine offered by them to the public is the result of long experience and close observation. Manufactured at the San Francisco Foundry, San Francisco, Cal. by
J. & W. C. SALMON,
To whom all orders should be addressed. 15

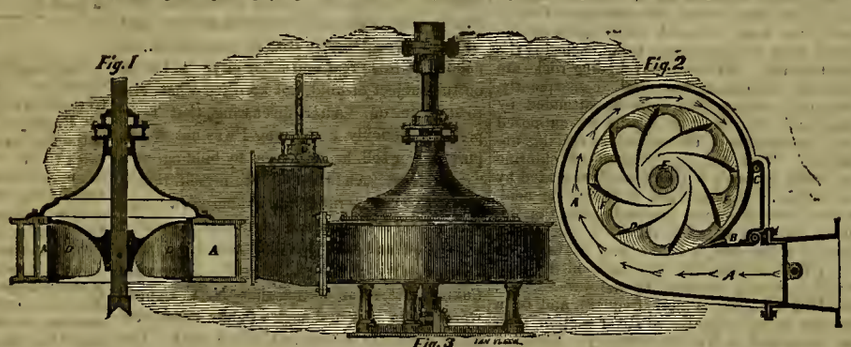
TYLER'S IMPROVED WATER WHEEL.

We subjoin both a perspective and a sectional view of Tyler's celebrated Improved Water Wheel, which is now in quite general use all over the eastern portion of the Union, and which is also on exhibition at the Pavilion in this city. Messrs. Smith & Hanscom, at the Golden State Iron Works, have purchased the patterns of this wheel, made expressly for this Coast, and are now prepared to receive orders for their manufacture in any required number, and of all sizes.

Parties having water privileges, and desirous of putting up a good and reliable wheel, will do well to examine this one, which is capable of doing all kinds of work, under all heads, from 3 to 80 feet. The wheels are made entirely of iron, are complete in themselves, and turned out from the shops in such perfect order that any ordinary mechanic can easily put them in place, thereby avoiding much expense involved in the setting up of most wheels in use. This wheel was invented by John Tyler, of West Lebanon, N. H., and has taken a high stand among the water motors of the Atlantic States. These wheels are extremely simple in their mechanism, and it is claimed that they possess great freeness from liability to choke up, thereby rendering them especially desirable for use in localities where the water may be muddy. The patterns in possession of Messrs. Smith & Hanscom, and from which the wheels on this Coast are to be made, have been prepared with the greatest care, under the personal supervision of the patentee.



The manufacture of these wheels in the East gives employment to a large corps of efficient mechanics, yet notwithstanding this fact, the patentee is unable to supply the wheels as fast as orders are received. We speak of this invention confidently because we personally know its established reputation and complete practicability.

For further information, persons interested should apply personally, or by letter, to Messrs. Smith & Hanscom, at the Golden State Iron Works, Nos. 21 and 23 First street, in this city.

REPORT ON MINERALS.—In another column will be found a full and interesting report upon the Mineral Exhibition at the late Fair of the Mechanics' Institute. It has been prepared with much care by Prof. Wm. P. Blake of this city, and will be read with much interest. This is the first full publication of a Report of any committee of the Institute which has yet appeared. We shall continue the publication of these reports from week to week, until the entire list is completed—giving each report in full, and officially.

A QUANTITY of heavy machinery is now in process of construction at some of the great iron works of Paris, designed for working some of the old Mexican mines.

More Light on the Whitman Mine.

THE WHITMAN LEDGE.—The Virginia *Union* comments severely upon the management of the Whitman Company, on this ledge. The ledge is found well-defined, continuing through the original location. The ore was found, by actual working test, to be good. Thereupon all holds were let go, and active operations suspended just when they could have commenced to be profitable. The *Union* says: "It can be proven, upon pretty good authority, that since the mine has turned out to be a 'good thing,' a regular instituted 'freezing out' game has been engaged in, for the purpose of concentrating the stock in the hands of an avaricious and unscrupulous few, which is highly detrimental to the interests of all stock holders of limited means. Well, a better order of things may some day be brought about, and the Whitman take its legitimate place among the good paying mines of the day. Let the stockholders still 'live in hope, if they die in despair.'" A similar policy seems to rule in the management of the Roger Sherman—the second location on the Whitman ledge. It was located in 1860, and worked steadily for something more than a year. Then work was temporarily suspended, for want of funds. The tunnel was closed, however, and notice given that no abandonment was meant. A party taking the name of "the Orion" entered upon the ledge, and commenced taking out ore. Instead of procuring the services of the Sheriff of Lyon county to forcibly and summarily eject the trespassers, a long suit was brought. It has been in court about eighteen months, and seems likely to be there continued indefinitely. All for want of good sense and the proper spirit in the management.—*Exchange.*

The above substantially corroborates the following significant prophecy which appeared in the MINING AND SCIENTIFIC PRESS of May 7th 1864:—

MESSRS EDITORS:—Considerable has been said concerning the Whitman mine in our sister district, and, to all appearances, it is a failure; but I assure you that the Whitman is only passing through the same refining process that every mine of value has been subjected to in the Territory. I do not hold a foot of stock in the company, nor have I a friend that does, to my knowledge. But let me advise all concerned to hold on to their stock. I can have no object in this other than to advise those concerned for the best. I am living here, and understand the whole arrangement, and I know the mine to be rich. There is a large amount of the ore at the mine, at this time, that will work $1,000 per ton. The mill, it is said, will start again in a few days. It may make another failure; but if it does I assure those interested that it will not be on account of the inferior quality of the rock, but for some other purpose. Why is it that somebody, who had considerable to do with the mine, is buying all the stock he can get his hands on, at this time?

COMO, N. T., April 28, 1864.

Novel Mode of Manufacturing Ice.

It is stated, on pretty good authority, that there is a novel mode of manufacturing ice employed by the natives of some portions of Bengal, which, if correctly stated, might perhaps be turned to convenient if not profitable account in other localities. The process is founded upon the well known principle of the conduction of heat or the creation of cold by evaporation. In the region alluded to (on the banks of the Ganges), the cold is so slight that a fire is not needed, for other than culinary purposes, more than six weeks of the year. Ice is there produced, in considerable quantity, after the following manner: A pit is dug in the earth, in the bottom of which straw is spread; upon this straw open vessels, made of burnt clay, of a slightly porous nature, are placed. After sundown these vessels are nearly filled with water, and into each one, beside the water, a small piece of ice is thrown. Before sunrise, the next morning, nearly all the water which has been placed in the vessels is frozen solid, notwithstanding the surrounding atmosphere is much above the freezing point. A small portion of the water percolates through the walls of the vessel and passes off, by evaporation, either from the outside of the vessel or from the straw upon which it is placed. The ice is produced by the extraction of caloric from the water by the process of evaporation.

The same principle is elsewhere employed for the ordinary purposes of refrigeration. On the coast of Coromandel, where the heat is almost intolerable, and no ice can be procured, except by importation, the water for drinking purposes is cooled after the following manner: A slightly burnt earthern vessel is filled with water, a wet cloth wrapped around it, and the vessel set in the open air; the extreme heat produces a rapid evaporation, and the moisture of the cloth is kept up by the slow infiltration of the water through the sides of the vessel, thus extracting sufficient calorie from the water as to make it very palatable, even in the hottest weather of a tropical climate.

THE VALLEY OF DEATH.—It is said that upwards of 150,000 persons have perished in the Shenandoah Valley since the breaking out of the present rebellion. It is well that Sheridan should make a desert of that region, so that the armies of neither side can be subsisted in that valley of death.

[Written for the Mining and Scientific Press.]

The Chlorides of the Great Basin—A New Theory.

EDITORS MINING PRESS:—In a recent number of the PRESS, I notice, under the heading of "The Formation of Chloride Ores," an extract from a lecture delivered at Austin, N. T., and endorsed with the sentiment that the theory "appears to be quite satisfactory, and will doubtless be generally accepted as correct." Against such an opinion allow me to appeal, for I believe the said theory to be less plausible than would be the assertion that mankind are singed apes, owing their metamorphosis to a volcanic epoch.

We are told that the learned Professor decides that the Great Basin of Nevada was once a vast sea of intensely salt water, heated and boiled by volcanic fires, and that the chloride ores of Reese River are the result of this grand operation. It is a wonder to me that the learned gentleman did not introduce the flood into his huge boiling cauldron, as a suitable accompaniment, and then add, as a compensation of nature, that the final conflagration of the world will only be a further desulphurizing and reducing process for the benefit of the joint stockholders in eternity. This would have developed a much needed opening for Eastern investments, in the expectations of futurity. What little knowledge I have gained as a humble student of Nature, has taught me that it is highly unphilosophical to refer to more than a few of its phenomena, even among those of the grandest scale, to causes outside of those already existing and in operation, particularly where the more simple action will serve to explain all anomalies. Those anxious efforts to league every natural exertion or efflorescence of matter with some monstrous spasm of the past, reminds me of the philosophers immortalized by Butler, the author of "Hudibras," who, in the intruding mouse and gnats of their telescope, saw elephants and armies deploying on the surface of the moon.

In the description of the *modus operandi* of the chlorination of the silver sulphurets we are told that salt is one of the necessary elements, and that heat is also required to create chemical action between the sulphurets of silver and the chloride of sodium, and, because there is evidence of former eruptive action and present internal heat throughout the Great Basin, that, therefore, the whole country was once a huge soup-pot, wherein silver ores were done to a turn, cooked tender and ready for modern dressing. I think that I can precisely imagine the epicurean avidity with which the antediluvians awaited the subsidence of the steaming contents of the Great Basin; how they sent their stentorian voices ringing down the odorous valleys with calls for "chloride chowder," "stuffed iodides," "bromide pudding," and "sulphurets on the half-shell!" No wonder that many a small fortune has since been *dished* in the same locality. The lodes themselves, it seems, were merely par-boiled—the hot water, by some curious freak, only finding its way to the depth of forty feet, the average line of the present upward flow of much deeper reservoirs of cold water. Considering the evident cruelty of soaking the delicate feet of the Reese River lodes in hot water for the benefit of their corneous collections, one can fancy them exclaiming with the man whose

shrewish wife exhibited the warmth of her affections in a shower of hot water, "for all previously conferred callous spots and a less area of pain, let us be thankful."

Now let us look at the case in its true light. No great distance intervenes between the points where chloride ores occur, and the saliferous gypsums yielding those saline deposits in the valleys below them, known as salt beds. The same geological strata occupy a broad belt between the parallels of Walker and Reese rivers, though not everywhere in place, nor close to the Reese River mines. The formation exists at an elevation greater than the lower flanks of the Toiyah-bee range, where, if ever present, it has been removed by denuding causes. From the crupted rocks beneath and adjoining it, flow springs of all temperatures, up to the boiling point, and heavily impregnated with sulphur and carbonate and chloride of soda. The absence of adjoining salt beds or marshes is no proof against the prior existence of saliferous gypsum beds at any point, because the salt deposits are evidently only kept in existence by the replenishing hot springs. The sources of supply once stopped, the salt would soon enter into new combinations, under the active influence of frequent rains and diurnal heat; for real stable deposits of salt are dry, and, consequently, much elevated, and appear to have been thrust up with great masses of rock, that fully protect them from outward elements. This much concerning the saliferous gypsum beds, for which, for many reasons, no geologist will attempt to give a hot-water origin. But if an intensely heated dyke of matter had ever come in contact with any portion of this formation, there would have resulted an unrecognizable metamorphism, and an evolution of muriatic acid gas, to be deposited again, in the form of salt, over the surrounding country, just as a similar deposit is sometimes made by volcanoes. Here we see that hot water is not absolutely necessary for the wide distribution of salt, particularly in the Great Basin.

Overlying the granite of Reese River is a limestone formation, undoubtedly older than the quartz veins enclosed by it and the granite. Limestone, or carbonate of lime, is known as a compound of the oxide of calcium and carbonic acid. This carbonic acid is one of the most easily removed associate of minerals. By dry heat it is either driven off in a gaseous state, or else, by having all escape prevented, enters into a crystalline arrangement of the particles of lime, thereby forming marble. In contact with other elements, especially silica, or with boiling water, and quite powerfully in the presence of both, it is removed from carbonates, and in solution tends to keep some compound elements in a fluid state, so much so that from the fact that the carbonic acid of the sea is five times greater than actually required to keep the carbonate of lime in a fluid condition, Bischof, a learned investigator, believes that it is impossible for the latter to have been deposited solely by chemical action. Boiling water, acting alike upon the silicates of the granite and the carbonate of lime, would have decomposed both by a series of mutual re-actions, and, under the highly favorable circumstance of no rocky lid compressing it, the tumultuous water would have emitted a continual vapor of carboaic acid. Had there been but a short epoch of such an operation as described by the learned professor, the rocks would have been metamorphosed by dissolution or chemical substitution, and new combinations beyond any recognition of their original formation; while the fact is apparent to the most superficial observer that the overlying limestone of the Reese River mines, as a general formation, is remarkably free from any such evidence, even in close contact with the granite. The greatest metamorphism of the limestone is adjoining veins, where partings have afforded channels of percolation for melting snows. The same characteristic is noticeble in the granite, with an additional weathering of the surface where the limestone has been long removed. The granite is found in places at an altitude of two thousand feet or more above flanking portions of limestone, and both formations alike contain chloride, and bromide ores, and therefore, according to theory, must have been equally and deeply submerged in hot water. How great would have been the heat absolutely required to keep such an immense body of water in continual ebullition—most assuredly a temperature and volcanic commotion, totally uncomparable with any visible results. And now let me ask if there is any precise or even loosely supported geological record of such a stupendous mass of boiling water ever having existed in nature?

Has anybody ever known sulphur to be boiled out of metallic sulphurets with salt water? Capitalists should lose no time in securing the hot springs and adjacent salt beds of the Great Basin, to monopolize the reduction of silver ores, or at least try them when the Professor gives a clear insight of the process. But, admitting this as a possible chemical operation, I will ask how in the exact laboratory operation described, the silver became satisfied with exchanging its sulphur for chlorine, and then refused to dissolve in the hot saline solution? This is a mystery puzzling to any one acquainted with the Augustin process of silver extraction. If it is claimed that the chlorides were taken up and afterwards precipitated, how so abundantly and exactly in the quartz veins alone, and by what now invisible bulk of reducing agents.

To my mind, the simplest explanation appears the most natural. As before stated, the salt is an abundant material of the adjoining country; minutely impregnating the rocks, it would have no marked chemical effect when diluted with water; but when existing in contact with silver ore, with just sufficient acidified water to keep it moist, and have a catalytic, if not a contributing influence, it would gradually change the ores into chlorides. It is well known that by the osmose or simple capillary action of a comparatively dry porous stratum above a moist understratum, carbonate of soda and chloride of sodium are brought to the surface as a white efflorescence. In this connection it is noticeable that chloride ores affect in the granite only the upper and friable portion, which is only intermittingly subject to the presence of water, and then chiefly as a column of surface percolation. In the limestone, the same class of ores, being on the sides of deeply cleft canons, are free from the continual presence of internal streams. That the salt may exist in very delicate quantities, is not belied by the amount of ore affected. Much less than the minute quantity often analytically found in springs, where its presence has been unsuspected, would, as an average ingredient of the internal moisture of the Reese River lodes, be sufficient, by osmose action, to chlorinize all the surface ores. No thoughtful physicist will believe that these ores could have existed in their present condition near the surface, during the period that must have elapsed since the region of Nevada Territory could have been last agitated by strong convulsions or heat, without a continual replacement of the chlorine. For there are quite a number of simple elements having a stronger affinity for chlorine than silver—the hydrogen of water being the most powerful, while some of the others form portions of the rocks enclosing the quartz veins. While the surrounding rocks are suffering decomposition and, consequently, chemical changes, that must be attended by modicums of heat, it is not to be supposed that the chlorine of the silver ore remains unaffected. That the combination of chlorine and silver is slowly but continually repeated by the surface action and aid of the nitric acid, washed down from the atmosphere by the frequent showers of that region, is simply an opinion of my own, founded upon the fact that every flash of lightning generates nitric acid, which is readily absorbed by the water-drops; and that lightning is more frequent, and on a grander scale, in the Reese River section, than any other part of Nevada Territory. Whether we adopt this or some other simple chemical cause, there is, I conceive, no more necessity of flooding the Great Basin with hot water, to account for a simple phenomenon, than there would be for the witches in the play of Macbeth to put a dozen assorted Reese River quartz lodes into their hell-brewing kettle, to work them into mischievous charms.

PUNDIT.

LIGHTING MINES.—As an improvement in supplying air to lights in mines, the Rev. W. R. Bowditch, of Wakefield, England, proposes to condense air by a pump, or other suitable means, and convey it in pipes to a receiver, and thence to the light to be supplied, or directly from the condenser to the light. The light, inked or in a safety-lamp, is placed in a lantern which has an aperture for the admission of the pure air, and one or more apertures for the exit of the air and products of combustion. The condensed air is conducted through a pipe, which fits tightly into the lantern, and by this air combustion is supported. The surplus air, and the products of combustion pass through the apertures made for that purpose in the lantern. The air being supplied to the lantern under pressure, prevents the entry of fire-damp or any other dangerous gas that may surround the lantern. Air under pressure is apt to extinguish lights supplied with it, and to flow to waste if the current be not regulated; to prevent this he passes it through a pipe or pipes obstructed by screw-plugs, or taps, or wire, or by combinations of these, or by other suitable means, so that its flow may be regulated according to the supply needed. He also uses the waste air blown off from engines worked by compressed air. In this case, the air which is blown off is received into a suitable box, with a valve, before it is allowed to mingle with the atmosphere, and it is conducted from the box to the light through a pipe or pipes as described. He also allows the air to escape around lights without enclosing them, but this plan is not so efficient or economic.

LADIES should never put pins in their mouths—their lips should be roses without thorns.

NEW YORK CORRESPONDENCE.

BY FRANK WARDELL.

[Owing to the detention of our Correspondent's valuable letters, we publish a few extracts only.—EDS. PRESS.]

WAR, NOT THE CAUSE OF HIGH PRICES.

Speculation is the cause of the present high prices at which the necessaries of life are being held—not the war, as many suppose; crush speculation, and food and clothing will return to reasonable figures. To do this, people should, for a season at least, live as economically as possible, buying nothing that is not absolutely necessary, and wasting nothing that can by any ingenuity, be turned to domestic account. As a people we are the most extravagant on the globe. This does not admit of a doubt. We destroy more than we use. Were we to live frugally and wisely for simply two years, the sum saved would pay off the National debt. But there is little sense in talking to those who look more to appearances and the condition of their tables, than they do to the interests of the country, or the successful termination of the war.

A STROLL ON WALL STREET.

Having not much on hand to do, a few days ago, I thought I would take a little quiet stroll on Wall street, and there, if possible, try and study out their "*modus operandi*" of doing business. I know it was attempting rather a difficult task, nevertheless, with a brave heart and firm determination, I "sallied forth." I made direct steps for the locality where the "noble bulls and bears" do congregate. Having arrived, and after duly "striking" a Montgomery street attitude, a sort of *neglege*, I commenced conversation with a gentleman who was dressed in the most exquisite manner, and whose actions denoted that he was one of the nabobs of this great and noisy city. I led off on the subject of gold, not knowing what else to start in on. After discussing that topic pretty thoroughly, and seeing I was not on the purchase or sell, he withdrew by bidding me a "good-day." Ah! thought I to myself, that is what we would term in San Francisco, a "cold shake." Not to be daunted in that manner, I started off and soon became mixed up with another party of "stock sharps." Some were talking Erie, some betting that N. Y. Central would go to such and such a figure; others said there was more money in Hudson stock. Out would come a blank check from the lining of their hats, (the repository which brokers term their street safe) and off they rush into the nearest office, fill up the same, and in less than five minutes I have seen as high as twenty thousand dollars closed. They have about the same system here as your "operators" have in California, regarding the raising of a stock in the market. What a busy street this Wall street is, people constantly on the go, rushing like so many wild men, here and there as if their lives depended upon reaching a certain place at a certain time.

HOW FRANK BAKER LOST HIS FORTUNE.

In the course of conversation with some of the brokers during my stroll on Wall street, I gleaned from them the points with regard to the manner in which Frank Baker, well known in California, was made the loser of almost all the money he had. It seems that Mr. Baker, in company with some other very wealthy men of this city, thought they would form a combination and buy in Harlem stock, which by such an operation, would as a matter of course raise it on the market. The principals in the transaction, were of course not to be publicly known; all transactions to be made through brokers. This they did and purchased immense quantities, one of their party, being the wealthiest of the clique, thought he would buy some on his private account, besides what he had put in the combination, the understanding being that they should all hold their stock for a certain time and throw it on the market by degrees, when the price suited for the mutual benefit of all. Instead of this, the combination seeing that this wealthy party above referred to, was on the buy, determined to play "sharp" and took their stock, "shoved" it into the market through different brokers, and of course this party would buy it at the high advanced rates. Intelligence of this somehow or other got to his ears and, he saw at once that he had all that he "could carry," and if he stopped buying the market would "lower" and the consequence would be he would be ruined. He therefore set his wits to work, and at last thought of a plan, and pops of to the prince of speculators, Cornelius Vanderbilt, and told him his position, stating that if he would back him he could, with what he had, make a few millions; Vanderbilt looked into the matter, saw the chance, and replied "go in" all the money you want I will supply. This was enough for the injured party and he continued to purchase all the Harlem that was offered. The combination having sold all of theirs, they asked him what he intended to do with so much stock. He replied that he had confidence and intended to invest all he had in it. The "combination" had a good laugh among themselves, and one said, then let us "sell short" on him. All right; so they sold several millions short. This the party also bought. Now they commenced to wonder. "What does this mean? Where does the money come from? But it was not long before their seller contracts became due, and to their astonishment, Harlem was 280 and none to be had at that, not one share. The consequence was they had to pay the difference and pocket the loss. One party I know of paid one million to be let off. This is only to illustrate how heavy they went in. Frank Baker, as near as I could ascertain, paid $500,000, which nearly broke him. So the combination learned there were other "smarties" beside themselves. Now, you cannot purchase Harlem stock; it is the choice article of the market. The party they intended to take the advantage of comes out several millions ahead. I make known this little game of "sharp practice" to your readers, for I feel convinced that it will in a certain degree, place them on their guard against similar operations which I have known to be "worked up" by certain brokers in your city.

The Big Trees.

The Stockton *Independent* informs us that "Sequoia" is a "new name for the class of trees known as the Big Trees." It says:

"Professor Brewer, of the geological survey is the first to apply the name. He communicates to the *Scientific Press* the fact that, in the mountains above King's and Kern rivers, these trees are often found, not in isolated groves, but scattered around promiscuously in the forests, at altitudes varying from five to seven thousand feet. He found one tree near Thomas' saw mill, forty feet in diameter; which is much larger than any in the Calaveras or Mariposa groves, and the Indians told him of another, north of King's river, much larger than this one. *That* tree ought to be hunted up and taken care of. 'Hercules,' the largest tree in the Calaveras grove, is but ninety-six feet in circumference."

Our cotemporary is in error on this point. The name of "Sequoia" is by no means new, as applied to the mammoth trees of Calaveras and Mariposa. Soon after the discovery of the Calaveras collection became known to the world, an English tourist undertook to christen the tree "Wellingtonea Gigantea." A patriotic American, indignant at the idea of permitting this wonder of the vegetable world to be called after a "Britisher," proposed the name of "Washingtonea Gigantea." Next came a learned German, who settled the whole matter to the entire satisfaction of the scientific world by declaring that the mammoth tree belonged to the same genus as the Redwood, which was already well known as a "Sequoia," and that, as being a larger *species* of the same *genus*, it would be most appropriately designated "Sequoia Gigantea." This has long been its accepted scientific name; and we are confident that so well informed and learned a botanist as Professor Brewer, could not have been ignorant of facts so widely known.—*Flag.*

The copy of the Stockton *Independent*, containing the comments above referred to, on the notes of the geological survey recently furnished us by Professor Brewer, has never been received by us, and we are under obligation to the *Flag* for its prompt correction, as above, of the error of our Stockton cotemporary.

THE Spanish-Peruvian Imbroglio is not yet at an end, and war between Spain, Peru and Chili is imminent. The Peruvians insist that the guano islands must be given up and the Peruvian flag saluted by Spain, or the full power of the Republic will be employed to protect the integrity of its territory.

AN imprudent gentleman leaning out of his car at the scene of the railway catastophe in Canada, had his head severed from his body by one of the supporting rods of the bridge.

Mining Summary.

CALIFORNIA.

El Dorado.—The *Democrat* of Placerville learns that Owen Donegan, of Saw Mill Flat, took from his claim, a few days since, a lump of gold weighing nearly three pounds, all the claims on this flat have been paying very well all summer, but the water has now given out, and the miners will have to rest on their oars until the rainy season sets in.

Nevada.—The Nevada *Gazette* says:—"The miners are returning to their old claims. Throughout the entire county prospecting for quartz is being done with excellent success. New mills are being erected, and daily, rich leads are opened. In anticipation of a favorable winter, of which there is every evidence, placer diggings are also being prepared for extended working. In addition to the above facts, the utmost confidence is felt in the mines of this county by capitalists. A gentleman who is well posted in regard to this matter informs us that 'Nevada county mines stand higher today than any others in the market.' Numerous men of means have visited this county in the last few months, examined our mines, and invested their money in them. These things and an unwavering confidence in the unlimited wealth of Nevada county, warrant the belief that our city and county have seen their darkest day. Nevada, we believe, will never be as dull again as it has been for the last six months. The confidence of our people has most substantial grounds for its existence."

Placer.—A newspaper correspondent from Iowa Hill, Placer county, says that shallow placer diggings, are few and far between. The only mining now followed in that vicinity, as well as along the whole "Divide" between the middle and north forks of the American, at Yankee Jim's, Todd's Valley, Forest Hill, Michigan Bluffs, and other mining camps, being hydraulic, or what is termed "deep diggings," where with a full head of water and sufficient fall a whole mountain side is "piped" down, as it is termed, and boulders weighing little less than a ton, sent spinning like a teetotum or a schoolboy's top. This and tunnels run hundreds of feet through the rim rock, compriss the great bulk of the mining operations in this section, and to practise the former mode successfully, a large amount of water is required.

The Southern Mines.—The Los Angeles *News* of the 19th says:

"It is reported that miners are flocking into the gold placers at Little Creek; San Bernardino county, in large numbers. Soledad, Ravena City, as we learn, has been almost depopulated; all are leaving for the new mines above mentioned. A large proportion of the miners have also left the El Paso and other mining districts north of this place. It is stated that all claims which have been opened are yielding richly; sixty to one hundred dollars a day have been taken out by two men on more than one occasion."

Calaveras.—The San Andreas *Register* of the 15th says:—Richard Kirby has discovered an exceedingly rich gold-bearing vein of quartz about eight miles south of this place, between here and Copperopolis, a specimen of which we have seen, and the rock is literally full of gold—gold being the rule and quartz the exception. It was found on what is called the Hunter Ranch by this man, who was crossing the ranch, and having picked up an old pick, knocked off a piece of the rock and found it full of gold. He and several other parties are now at work upon it, and have already taken out a large amount of gold, using nothing but the pick and pan. They took out of a place not over six inches square what they estimated to be at least $25. It seems to be decomposed quartz and easily worked. They are down on the lode about eight feet, and are endeavoring to find the main vein. There are seven or eight small veins, not more than an inch wide near the surface, but growing wider as they go down. These they have traced about twenty feet, pitching towards the west, where they take a sudden turn and go down, pitching a very little toward the east. It is thought they will lead to one main vein, which must be very rich if it is like that already discovered. The most of the gold is very coarse, but some of it is as fine as flour. It has every appearance of being the richest thing struck in this country for a long time.

Sierra.—The Downieville *Messenger* learns that the mining companies at Saw Mill Flat are busy, employing all the men they can find room for. The Union has about forty; the Franklin about twenty-five. The Monitor Company are putting in one of Fredenburg's hydraulic wheels and building a timber house. The other companies are head and ears in bed rock.

At the new camp at Ironsides about which cluster considerable quartz interests, three companies are at work. The Ironsides mill commenced running about three weeks since, and works to perfection, and every thing about the claim appears to be driven forward in a systematic manner. The Ohio company are running a tunnel of about 500 feet. The Sixty-ninth (north extension) are also running a tunnel to tap their claim lower down.

Much work has lately been done at the Oak Flat Co's ledge. A breast of several hundred tons has been crushed, averaging from eight or ten to fifteen dollars per ton at different runs of the mill, improving as they sink on the ledge. The company are running a small mill and working their claim on sole principles. The partners are mostly laboring men of small means. The Eagle claim and extension is not being worked this Summer.

There are other claims on Kanaka Creek the same side of the ridge from which hundreds of tons of quartz of good quality are being taken, and it is probable that in the course of another Spring these will be sufficiently proved to warrant the building of mills. The gravel claims interest on this side of the county has already become secondary to quartz, in which large investments of capital are constantly being made. The American Company at American Hill are running their mill, having, through a bed-rock tunnel, got well in upon their ledge, which looks exceedingly well. The gold is fine and the sulphurets in some places are unusually coarse. Other mining is pretty much suspended at present, but, considering the dry season, has done better than an average through the country. The Mt. Moriah and Morning Star ledges, located respectively on Great and Little Wolf Creeks, surpass all other discovered ledges of this county in size. During the progress of development, rich specimens are constantly found; and what is most remarkable, all this rock prospects well.

WASHOE.

The Dayton *Sentinel* says that Mr. D. L. Smith, of that place, is now busily engaged in building a ditch and flume, of about 125 rods' length, from the mouth of Gold Cañon to the vicinity of Mineral Rapids mill, where he will shortly put up an eight-stamp quartz mill. Mr. Smith assures us that he will have an ample supply of water, with a fall of over eighty feet.

The Rock Point Quartz Mill resumed work a few days since, having been idle a week to admit of repairing the race, which has been so improved as to enable it to carry an additional body of water, so that now, at the very low stage of the Carson, the supply is sufficient to fill the race, thus enabling the mill to run the full number of stamps—at present numbering forty. In a short time sixteen more will be added.

The Woodpecker mill, lately destroyed by fire, is to be rebuilt without delay. Mr. J. S. Aiken is the contractor.

The Carson *Independent* says that beautiful town is marching rapidly on in the career of prosperity. Several quartz mills are being erected there, and the citizens are generally enterprising and active in promoting improvements.

ESMERALDA.

The new mining district, located about fifty miles southeast of Aurora is creating considerable interest. People are flocking thither from every direction. A town has been laid out and the mines are said to be exceedingly promising. The Esmeralda *Union* says of the Oxford Beta:—

This splendid tunnel is being pushed forward with commendable energy. It is now in over three hundred and fifty feet, and must soon, it is believed, strike the Winnemucca lead. Work is continued night and day. The rock is extremely hard, however, and consequently the progress being made is not so great as it was hoped it would be at the present stage of advancement. The Oxford Beta stands high in the estimation of the miners of this district, and much credit is due the Superintendent, Mr. Lytle, for the scientific manner in which the work is prosecuted.

REESE RIVER.

According to the *Reveille*, Messrs. Morgan & Muncey have leased the Hildreth mill, and are now engaged in making extensive and permanent improvements upon it. D. W. Brooks, their chief carpenter, has lately purchased all the lumber necessary to enclose the roasting furnaces, and to make the mill comfortable and secure. They will put up a new retort, and are having a foundation dug out for the purpose of putting up a new drying kiln. They will also have three wooden amalgamating tabs, instead of the iron pans heretofore in use. When all the improvements are completed, the mill, for its capacity, will not be surpassed by any in the city. These repairs do not interfere with the working of the mill, which will be ran without intermission while they are going on.

The *Reveille* gives a lengthy description of the extensive works now in progress by the New York and Reese River Company, which are located in Telegraph Cañon, about three miles north of Austin. This company is an organization of New York capitalists, whose headquarters are in that city, and are also the owners of the Manhattan and Knickerbocker mills of Washoe, under the names of New York and Washoe and New York and Nevada Companies. The acting manager of the company in that section is Mr. J. V. Robbins, who is driving the business ahead with great energy and cute. The name by which the mill which the company is now erecting will be known is "Midas"—a most appropriate selection, as Midas, in heathen mythology, was one who possessed the power to turn into gold whatever he touched with his talismanic wand. The mill will be of the latest and most approved mode of construction, with roasting furnaces, railroads, amalgamating barrels, etc. The building will front 165 feet; the roasting room being 100 by 50 feet, forming an L with the mill building, which is 80 by 50 feet, the boiler room being an addition of 15 feet. The main building is of granite, the walls being of great strength. The roof will be of trestle work, covering the building with a single arch. The furnaces are being constructed under the direction of Mr. J. H. Demorest, who has had much experience in such work. The wood work is being done under the direction of Mr. E. D. Belle. The rock will be crushed dry, and will fall from the batteries into boxes on cars, these standing on a track that runs over the roasting furnaces. There are to be five furnaces, capable of receiving charges of 1,200 pounds each, connected by flues with a circular chimney stack 50 feet high. These furnaces are upon a pattern somewhat different from those in common use, but are upon the reverberatory principle. The amalgamating of the roasted ores will be done with Freiburg barrels, while the unroasted ones will be worked in two of Varney's improved pans. The works will be driven by a 75-horse power engine. The company owns quite a number of lodes in the vicinity of the mill. Col Robbins, brother of the Superintendent, and late in command of the 8th Wisconsin volunteers, in active service in the East, has charge of the mines, and is developing them with much energy and skill.

From the *Reveille* we also learn that the new silver mines in Rush Valley, southwest of Salt Lake, have been prospected and worked considerably. Gen. Connor, commander of that department, has sent a silver bar to Miller & Lundhom, the ore from which it was obtained assaying $714 to the ton. Extensive preparations are making to develop the mines next spring.

Washington district is known to be exceedingly rich in various kinds of ores, and all that has been needed was works to get the silver out. The *Reveille* learns that Don Alvarez, the sole owner of the St. Helena ledge, is at present putting up two large blast furnaces, together with a reverberatory furnace, for the purpose of separating the silver from the lead. Two engines that he purchased at Silver City have arrived and been put up. These extensive improvements will be in working order by the middle of December.

HUMBOLDT.

The Humboldt *Register* says that work has been again resumed on the Mars claim, and that ore will soon be arriving at the mill. The Evening Star company has about 150 tons of fine ore taken out, and still continues piling it up. The Gem is hauling ore to the Falls Mill.

Fires were lit in the furnaces of the Trinity Mill on Thursday of last week, and the *Register* says that the engine works beautifully. The mill will be running on rock within ten days. Teams have gone to the salt marsh for a supply of salt.

The Manhattan Ledge is a recent location in Oro Fino District, south and west of the Natchez ledge. It is said to be a well defined ledge, three feet thick in croppings, which are similar to those of the 'Gem,' only having more gold. Locations made by Ed. Crutchley, discoverer of the Chihaahua. A sample of ore recently assayed by D. D. Robertson, yielded at the rate of 586 ounces to the ton. The company is called the "New York."

A small 5-stamp mill has just been built by Prescott & Schiedel at Marysville, for the "Alpha" Company. The mine is being put in order for active operations against the time when the mill will be ready to start.

The Belmont company has out about six tons of fine ore, and will soon have a larger force on. The Lady Franklin company held a meeting on the 7th instant, for the purpose of making arrangements to work the mine. It is thought pay ore can be taken out without any preliminary work.

OREGON.

The Dalles *Mountaineer* says that recent discoveries favor the opinion that Rock Creek is the Sinker Creek discovered by the lost emigrants many years since, and that it was on this creek they found the gold of which so much has been said. The marks of an old wagon road, which is believed to have been used by Meek and his party have been found, and from certain other indications, it is thought that the Rock Creek of to-day and the Sinker Creek of tradition are identical.

The Poetry of the Steam Engine.

There is something awfully grand in the contemplation of a vast steam engine. Stand amid its ponderous beams and bars, wheels and cylinders, and watch their unceasing play; how regular and how powerful! The machinery of a lady's Geneva watch is not more nicely adjusted—the rush of the avalanche is not more awful in its strength. Old Gothic cathedrals are solemn places, preaching solemn things; but to the deep thinker, an engine-room may preach a more solemn lesson still. It will tell him of mind—mind wielding matter at its will—mind triumphing over physical difficulties—man asserting his great supremacy—"intellect battling with the elements." And how exquisitely complete is every detail!—how subordinate every part toward the one great end!—how every little bar and screw fit and work together! Vast as is the machine, let but one be but the tenth part of an inch too long or too short, and the whole fabric is disorganized. It is one complete piece of harmony—an essay upon unity of design and execution. There is deep poetry in the steam engine—more of the poetry of motion than in the bound of an antelope—more of the poetry of power than in the dash of a cataract. And ought it not to be a lesson to those who laugh at novelties, and put no faith in inventions, to consider that the complex fabric, this triumph of art and science, was once the laughing sleek of jeering thousands, and once only the waking phantasy of a boy's mind as he sat, and in seeming idleness, gazed at a little column of vapor rising from the spout of a tea-kettle?—*American Artisan.*

Franklin and his Paper.—Soon after his establishment in Philadelphia, Franklin was offered a piece for publication in his newspaper. Being very busy, he begged the gentlemen would leave it for consideration. The next day the author called and asked his opinion of it. "Why, sir," replied Franklin, "I am sorry to say I think it highly scurrilous and defamatory. But being at loss on account of my poverty, whether to reject it or not, I thought I would put it to this issue—at night, when my work was done, I bought a two-penny loaf on which I supped heartily, and then wraping myself in my great coat, slept very soundly on the floor till morning, when another loaf and mug of water afforded a pleasant breakfast—now, sir, since I can live very comfortably in this manner, why should I prostitute my press to personal hatred or passion for a more luxurious living?"

One cannot read this anecdote of our American sage, without thinking of Socrates' reply to King Archelaus, who had pressed him to give up preaching in the dirty streets of Athens, and come and live with him in his splendid court. "Meal, please your Majesty, is half-penny a peck at Athens, and water I get for nothing."

How to Discover and Cure the Small Pox.—The *Electric Journal* says concerning this matter; "Now we offer this secret to the profession—as soon as the eruptions appear, by pressing with the point of the finger there may distinctly be felt the small, hard substance, precisely as if a small fine shot had been placed under the cuticle of the skin. This peculiar appearance belongs to no other disease. We have applied the term secret, here; for whilst it is, and has been known to a few physicians, it is not mentioned in any of the standard authorities; nor does the writer claim the credit of the discovery. After this all works upon practice will add this unfailing diagnostic symptom." The treatment of the small pox in the State Almshouse of Massachusetts, where the disease has prevailed during the last three months, has been singularly successful. Out of about sixty cases, but one fatal result has occurred, and that was the case of a man who was taken to the house from a neighboring town, in the last stage of the disease. The remedy used was a tea made from a plant known in the *Materia Medica* as *Garracenia Purpura*, familiarly called Ladies' Saddle, or water cup, the medicinal virtues of which lie in the root. The effect of the remedy, which has been newly discovered, and found remarkably efficient whenever tried, is to allay the fever and irritation caused by the formation of pustules, which are rapidly dried up, leaving but slight, if any, trace of the malady.

The horse-railroad drivers of Philadelphia were lately on a strike. They were demanding two dollars a day.

City Stock Reports---San Francisco Stock and Exchange Board.

From the "Weekly Stock Circular" of the Associated Brokers.

San Francisco, Saturday Morning, Oct. 22d, 1864.

Transactions at the Board since Saturday last, have been heavy in nearly all the leading shares, and lower priced stocks were also buoyant. The former have ruled at lower rates, but for the most part have been well maintained in view of the large sales, and the sudden and material rise of last week. The flattering condition of many claims on the Comstock is a subject of congratulation in stock circles and not only adds strength to the whole market but inspires the hope that the future of these mines will be no less promising.

During the past quarter the receipts of Bullion from Virginia City, Carson, Gold Hill and Silver City, have amounted to $2,848,000. Reese River has sent forward in this period about $200,000, and from Esmeralda $225,000 have been received, making an aggregate from Nevada, for the past three months of $3,275,000. This is a gratifying exhibit, and shows that the leading interest of the Territory is growing in importance and is well worthy the attention of our capitalists and all others engaged in these pursuits.

The money market is growing easier and capital is becoming more abundant. The establishment of a number of foreign banking agencies in this city will materially aid in promoting still greater ease.

Legal Tender Notes have been dull and inactive at lower rates, $18,500 were sold at 49½@49 cents. Latest telegraphic advices from the East denote a fluctuating market for gold. New York quotations of yesterday's date were 207 with a declining tendency. California State Bonds are inquired for at 75, and San Francisco 7's are offered at 72½. San Francisco 6's of 1858 are held at 64, and Sacramento County Bonds at 50.

Savage is in somewhat less favor and has declined from $2,000 buyer 15, to $1,800. Within this range 28 feet have been sold, and at the close $1,725 was bid $1,800 asked. Receipts of bullion from this mine, so far the current month, exceed $125,000.

Gould & Curry is also lower, and 49 feet have changed hands, advancing from $1,650 to $1,725, falling to $1,660, rallying again to $1,695 and steadily declining to about $1,610 This claim is yielding an average of some $7,000 per day. Advices from the mine are favorable, and good ore continues to be met with at a depth of 100 feet from the lower level.

Potosi has been in rather better favor, and rose from $810 to $850, at which rates 11 feet were sold. The argument before the referee in the suit of this Company with the Bajazet has reached a conclusion and a decision is looked for next week.

Chollar has continued to advance, and 18 feet were dealt in, within the range of $915 and $950. The southwest drift has now penetrated the face of the ledge, in this part of the mine, a distance of 112 feet every portion of which is said to contain good ore. The lode is also widening as depth is attained. In reaching the 5th level in the north mine from the main shaft, some difficulty has been met with, but future progress will, it is thought, be more satisfactory. The company are now hoisting some 80 tons of ore per day.

Yellow Jacket is in more request, and rose from $725 to $800, closing at $800. At these rates 23 feet were sold. Developments in this mine are of a favorable character, and a number of mills are now employed in crushing ore.

Hale & Norcross has been more active than usual, and 25 feet changed hands, declining to $450, rallying to $470, and held yesterday at $490. Indications in the different drifts from the lower levels are thought to be flattering.

Ophir has been a feature of the market, and 94 feet changed hands, dropping from $470 to $390, rallying to $455, then selling at $425 seller 30, and closing at $450 asked. Good ore has been found recently in the 5th station of the mine, and other portions of this claim are regarded as most promising.

Uncle Sam is in less request, and declined from $360 to $200, and rose to $220. Last evening $225 was bid—$250 asked. The rumors touching a consolidation of this company with the Overman we cannot trace to a reliable source. Negotiations are pending, however, which may lead to a settlement.

Overman has been sold to the extent of 96 shares, advancing to $250, declining to $150, rallying to $160, and closing at $180. The activity in this stock has been occasioned by the prospect of an arrangement with the Uncle Sam, which would, it is thought, end all litigation.

Imperial rose from $149 to $155, declined to $150, seller 30, and sold yesterday at $148@149. Some 150 shares were sold. Receipts of bullion this month are large, and a dividend of $7.50 per share will doubtless be declared out of the net earnings.

Burning Moscow has absorbed a large share of the attention of speculative dealers, and 1,892 feet were sold at variable rates, opening at $59, advancing to $92, buyer 30, and $88 cash, rallying to $80, buyer's option, and closing at $68. Some important developments have been made lately, but it is difficult to ascertain their real character.

Daney rose from $30 to $35, fell to $25, and sold yesterday at $27½. Sierra Nevada revived this week, advancing from $30 to $55. It was offered yesterday at $44. Within this range 180 shares were sold.

Bullion has steadily advanced from $80 to $110, and closed firmly at $120 bid. 119 feet changed hands at these rates.

Baltic rose from $33 to $43 and declined to $33. Michigan was sold at $12, Do Soto at $16½, and Pride of the West at $6½@7½.

Buckeye has been active at lower rates, and 346 shares were sold, declining from $8 to $6, and closing at $6½. An assessment of $3 per share was levied yesterday.

North American was in request early in the week, and 113 shares changed hands, advancing from $52 to $67. Yesterday $37½ was bid, $40 asked.

Nevada (J. G.) was sold at $40@45; Sheba at $65; Real del Monto at $24@25; and Antelope at $50.

Wide West has been well maintained. 205 shares were dealt in at from $26 to $28. Golden Age and Empire advanced from $11 to $13½

The aggregate sales of stocks since Saturday last amount to $488,458.

Commissions on Mining Shares.

Sale at 1 dollar up to 10 dollars	$0 25 per foot
Sale at 10 dollars up to 25 dollars	50 per foot
Sale at 25 dollars up to 50 dollars	1 00 per foot
Sale at 50 dollars up to 100 dollars	1 50 per foot
Sale at 100 dollars up to 200 dollars	2 50 per foot
Sale at 200 dollars up to 400 dollars	5 00 per foot
Sale at 400 dollars up to 600 dollars	6 00 per foot
Sale at 600 dollars up to 800 dollars	7 50 per foot

From $800 to $3,000 per foot, one per cent, on the amount of purchase or sale.

Anything above $3,000 per foot, three quarters of one per cent. on the amount of purchase or sale.

FRANK LAWTON, Secretary. J. B. E. CAVALLIER, President.

Mechanical.

A Naval Mystery. It is well known that much mystery has been kept up with regard to the motive power that is to be employed on the ironclad Dictator and Puritan. A late number of the N. Y. *Times*, speaking of this matter, makes the following interesting and important statement :—

It is quite useless to conceal the fact that no steam power will propel the great iron-clad Dictator on her forthcoming European voyage. The Ericsson caloric engine will be the motive power, and the manner in which its progress at the Delameter Iron Works has been effected without the slightest intimation on the part of the press that anything mysterious was going on, shows that the contractor attaches undue importance to secrecy. If the engine fails—as fail we are assured it cannot—this Country must know the fact some time or other; if it succeeds, premature announcements cannot impair, but must necessarily enhance the triumph of genius. The Dictator is now slowly fitting out. The Puritan is not known to have a caloric engine, but it is not unlikely that her moving force will be the same as that of the Dictator, if that should succeed, as the Puritan cannot soon be finished.

Something New.—At the carpenter shop of W. H. Blood, Esq., on C street, between Fourth and Fifth streets, may be seen the greatest novelty in the way of a washing machine that it has ever been our luck to look at, and it is really well worth the trouble of a trip round town to see it. It completely does away with hot stoves and dirty kitchens on wash day, for it at one operation boils, washes and wrings the clothes that are subjected to its cleansing process. It is not quite equal to the Yankee machine, into one end of which you might place a live sheep and take from the other your dressed mutton, tanned sheep's skin, hank of wool yarn, and a dozen fine tooth combs, but into one end of this institution place your dirty clothes and in transitu you will have them boiled, sonped, rubbed and wrung ready to be hung on the line for drying. Just think of it ladies and go look at it, and take our word for it you will instantly say, "why, it works like a real flesh and *Blood* machine." Mr. Blood received a patent for this product of his inventive genius January 12th, 1864, and is now for the first time manufacturing them for sale. And all that remains for him to do to make his fortune is to *advertise*—"a word to the wise," etc.—Marysville *Appeal*.

Severe Trial on a Gun.—The Hartford *Press* gives the following account of a trial of one of Ames' wrought iron guns The size of the gun is not given, but we suppose it must have been a large navy gun :

The gun trial by Ames was a lighter one than that tried at Bridgeport. He loaded it to within fourteen inches of the muzzle with powder and wadding, then put in a projectile eighteen inches long, projecting from the muzzle one-third of its length. He then placed the gun close against an embankment ten feet thick, composed of several tons of iron backed up with earth, and set a slow match to the gun and fired it. The enormous gun recoiled sixty feet and drove the projectile through the solid embankment of iron and earth.

This certainly was a severe test of the strength of the gun, almost too severe to serve any practical purpose without injuring good iron.

Drilling Upward.—A machine has been invented for boring upward from tunnels, for the purpose of ventiluting mines. We have not seen the machine, but it is described as working about in the same way as augers used in boring salt and oil wells. The auger is spliced as the work progresses, and as the boring is upward there is no trouble about cleaning the hole of chips, as they drop down as fast as made. A three-inch air shaft is just as good as a means of ventilation as one three feet in diameter.—*Enterprise*.

Washington's Sword.—The Fishkill (N. Y.) *Journal* says : We have lately learned a fact which is new to us, and probably will be to most of our readers. The sword which General Washington carried through the revolution was made in this village, at a shop which then stood near what is now the residence of Charles C. Rogers. This venerable weapon is now in the Patent Office, at Washington, and still bears the imprint of the maker's name, in these words : ' J. Bailey, Fishkill. '

The New York *Express* says that the Printer's Union, by their last strike, will bring 2,000 women into the trade within a year and half as many apprentices. Much of the printing labor in the country is now performed by women. The former will make $10 a week or $500 a year. The types on three of the New York city weekly journals are now mainly set by women.

The Hammer and the Pen.—We read that the pen is mightier than the sword ; reasoning metaphorically, the statement is true. But the hammer is more powerful than either, by the argument that deeds are more cogent than words. The pen inspires mankind to great efforts by the glowing words proceeding from it. The sword hacks and carves a brilliant name for him who wields it ; but, before its advance, the nations of the world shrink back in dread, and the women and children cower in fear. By the light of the bursting shell, or the glare of dwellings in flames, it stands out and gleams balefully against the sky, and only over human anguish and agony does it stride to triumph and renown.

Who ever feared the hammer or its deeds? Those who rush along the iron roads of the land—those who plow the waters of the river or the ocean—these experience the triumph of the hammer, know well its power and how indispensable it is. The pen may stimulate and incite to greatness, but it cannot achieve it ; the sword bends all things to its will, but it burns like a consuming fire and mankind writhes in agony before it. Only the hammer is all powerful and peaceful. By it thousands live and grow rich. With it men amass wealth and build up the bulwarks of the nation ; hunger is kept at bay, and famine is put to flight ; peace exalts her head, and hard-fisted toil finds no time, leisure or inclination to wreathe the bow of Mars. The pen bows to the hammer and does it homage. A man may live in physical comfort without a book in the house, but he cannot exist without being indebted to the hammer or its equivalent. The pen sings the praises of the hammer and indites eulogiums upon its numerous achievements ; few are the monuments the hammer deigns to raise in honor of literature. The pen is mightier than the sword, because it achieves its object through reason and not force, and also in that it is infinitely more civilized and humane in its effects upon the world ; but the hammer conquers even more territory than the pen, and is, in this way, invincible. No country is too remote or wild, too savage to resist its weight ; nor any metal, wood, or vegetable powerful enough to defy it. Without the hammer—a symbol of toil, as the pen is of thought and the sword of violence—the world could not exist in comfort and refinement.—*American Artisan*.

An Exciting Incident.—A correspondent of the Gold Hill *News* gives the following account of an incident which occured on board the Panama Steamer Costa Rica, on one of her late trips to New York :—

One night about eleven o'clock, the engine was suddenly stopped, the firemen were ordered to throw open their doors, and the alarm of fire was given. One of the huge journals on the main shaft had become almost red hot from friction and want of oil, and had set fire to the surrounding wood work. The conflagration was fortunately extinguished, but an examination showed that other portions of the machinery were in equally as bad a condition, and during the remainder of the trip four streams of water from hose were kept constantly upon different journals, to prevent their setting the ship on fire. So intolerable did this state of things finally become, that a committee of gentlemen, several of them leading business men in San Francisco, were appointed to wait upon Captain Jones, and request him either to run into a port and ballast the vessel, or land us on some of the West Indies that we were fast approaching. He took the former alternative and concluded to enter the harbor of Cape Haytien on the island of Hayti, which is the U. S. naval depot in the West Indies.

Who Invented the Iron-Planing Machine?—There have been few valuable inventions without several claimants for the honor of their origination. One of the most valuable of all machines is the planing-machine for planing iron ; and it is not too much to say that, without it, the machinery of the present day could never have reached so high a degree of perfection as it has. According to Mr. Smiles, in his "Industrial Biography," the merit of inventing this ingenious machine is claimed for no less than three English mechanics, viz.: James Fox, of Derby, Richard Roberts, of Manchester, and Joseph Clement, of London. The exact date of the invention is not clearly ascertained, but it appears to have been somewhere about the year 1814. It is certain, however, that for many years later than this, Joseph Clement's was the only machine in London capable of planing anything of large size ; and all other machinists of that city had to send their large work to be planed by it. The machine is said to have earned ten pounds per day. We presume that other countries might dispute with England the honor of this meritorius invention. We have no data which afford any knowledge on this point ; but we feel some curiosity to know the earliest period at which this machine was known in the United States.—*American Artisan*.

PROGRESS OF THE GEOLOGICAL SURVEY OF CALIFORNIA.

CONTINUED FROM LAST WEEK.

THE RELATIVE AGES OF THE MOUNTAIN CHAINS ON THE PACIFIC SLOPE.

In regard to the relative ages of the different mountain-chains of the Pacific coast, a few words may be added, premising that this subject will be as fully discussed as our materials will admit, in the Report.

There can be no doubt that the chain of the Sierra Nevada is older than the Rocky Mountain chain, or that group of chains or ranges which forms the eastern border of the great mountain region of the western side of the continent. The great mass of the Sierra was uplifted and metamorphosed after the termination of the Jurassic epoch, and prior to the deposition of the Cretaceous, for we find the last named formation resting horizontally and unaltered on the banks of the Sierra, all through Central California. The same statement is probably true with regard to the ranges east of this main crest of the Sierra Nevada, as far at least as the 116th meridian. But, although we have good reason to believe that these last-mentioned ranges were uplifted and metamorphosed after the close of the Jurassic period, we have not positive evidence that this took place prior to the Cretaceous epoch. Still, combining all we know of the geology of New Mexico and Nevada Territory, there appears to be little doubt that the system of the Sierra Nevada extends over a considerable area, east and west, embracing a number of nearly parallel ranges of mountains, some of which, indeed, are little inferior in extent and elevation to the Sierra Nevada proper.

We have recognized at least three distinct periods of upheaval and metamorphic action in the coast ranges. The main one was at the close of the Cretaceous ; the next in importance was after the deposition of the Miocene tertiary—or, at least, of a group of strata which, for the present, may be referred to that age. The next in age is a system of east and west upheavals, which took place at the close of the Miocene ; and the third is one which appears to have commenced during the later Pliocene, and to be still going on.

It is a very interesting fact, that the exterior of the coast-ranges—that is to say, the mountains nearest the Pacific—are of earlier date, or older geologically, than the interior ones, or those which border the Sacramento and San Joaquin valleys. This is a repetition on a smaller scale of what has been the course of events in the formation of the whole continent, the exterior lines having been first marked out, and the interior filled up afterwards.

THE DEEP GRAVEL RANGES.

The vast Tertiary formations on the flanks of the Sierra Nevada, so important as being the locality of the hydraulic mining operations, are not of marine origin, as has been so often asserted. The history of these deposits, their position, age, and other characters, are exceedingly interesting ; but it is impossible, in this connection, to do more than hint at some of their main features.

There is perhaps no subject connected with the geology of the Pacific coast, in regard to which there are so many misapprehensions, as there are in what has been published by geologists on the nature and distribution of the detrital deposits which are so extensively worked by the methods known as hydraulic and tunnel mining. It has been assumed that these deposits are of marine origin, and that they originally extended over the whole western slope of the Sierra Nevada, a condition of things which, were it true, it would be of vast importance for California to know ; but the real facts of the case are entirely different.

In the first place, these deposits are not of marine origin, as is proved by the fact that, although frequently found to contain impressions of leaves, masses of wood and imperfect coal, and even whole buried forests, as well as the remains of land animals, and occasionally those of fresh water, not a trace of any marine production has ever been found in them.

Again, these detrital deposits are not distributed over the flanks of the Sierra in any such way as they would have been if they were the result of the action of the sea. On the contrary, there is every reason to believe that they consist of materials which have been brought down from the mountain-hights above and deposited in pre-existing valleys ; sometimes in very narrow accumulations, simple beds of ancient rivers, and at other times in wide lake-like expansions of former watercourses ; and this under the action of causes similar to those now existing, but probably of considerably greater intensity. This deposition of detritus, for the most part auriferous, took place during the later Pliocean epoch, and not as late as the drift or diluvial period, as is abundantly proved by the character of the remains of plants and land animals which are imbedded in it.

The deposition of this auriferous detritus was succeeded, throughout the whole extent of the Sierra Nevada, by a tremendous outbreak of volcanic energy, during which the auriferous gravel was covered by heavy accumulations of volcanic sediments, ashes, pumice, and the like, finally winding up by a general outpouring of lava, which naturally flowed from the summits of the Sierra through the valleys, into the lake-like expansions, filling them up and covering over the auriferous gravels, which were to remain for ages, as it were, in a hidden treasure chamber, concealed under hundreds of feet in thickness of an almost indestructible material.

The effect of the denudation which has taken place since these streams of lava flowed down the mountains, has been most extraordinary. For now, these deposits of gravel and overlying volcanic materials, instead of occupying the depressions of the surface, are found forming high plateaux between the present river cañons and flat-topped ridges, known as "Table mountains," hundreds, or even thousands, of feet above the present river beds. Thus the topography of the country is exactly the reverse of what it was at the commencement of the present geological epoch ; what were once valleys are now ridges, and the ridges of former times were where the immense cañons of the rivers flowing down the western slope of the Sierra now are. The proof of this assertion, and the interesting bearing it has on the tunnel and hydraulic mining interests of California, will be fully set forth in the Report of the Survey.

The Mammalian remains found in the tunnel and placer diggings of California seem to belong to two distinct epochs. The oldest represents the Pliocene, the other the Post-tertiary. The former are found under the volcanic beds, the latter in deposits which have been formed since the period of greatest volcanic activity, and which apparently belong to the epoch of Man. For it appears that the facts collected by this Survey, when fully laid before the public, will justify the assertion *that the mastodon and elephant, whose remains are so widely and abundantly scattered through California, have been cotemporaneous with Man in that region.*

The above are a few of the more interesting facts developed by the Geological Survey of California, and of which the full details will be laid before the scientific public with as little delay as possible.

METALLURGY AND MINING.

Particular attention will be paid to these departments of the Survey during its continuance, and no pains will be spared to throw all possible light on the mode of occurence of the valuable metals and ores, the method of working them, and the processes now in use on the Pacific coast. It is estimated that two volumes will be required for this division of the Report.

BOTANY.

It is believed that the progress in this department, under Prof. Brewer's direction, has been sufficient to warrant the assertion that a "Manual of the Botany of California" will form a portion of the work of the Survey. The large collections of plants already made have been distributed to different high authorities in each department, and Prof. Brewer expects to return to the East in a short time, to commence the preparation of such a work as, it is believed, will be a most important help to the study of the botany of the Pacific coast.

ZOOLOGY.

The working up of the zoological collections of the Survey is now in progress under Dr. Cooper's direction. It has not yet been decided how many volumes will be required for their full description and illustration.

The publication of so large a mass of materials will necessarily occupy several years, and it will of course depend on the action of future Legislatures how fully and how rapidly our results are laid before the public in a printed form. Three volumes are already provided for, and, as has been already stated, they will be sold at a moderate price, and the proceeds, as required by law, paid over to the common school fund of the State.

J. D. Whitney.

Northampton, Mass., Aug. 1, 1864.

Insects as Food.—In Africa they eat ants stewed in butter. In Sweden they distil them with rye, to give a peculiar flavor to brandy. Pressed ant eggs yield a mixture resembling chocolate with milk, of which the chemical composition really resembles that of ordinary milk. The large termites, or white ants, which are so destructive to houses and furniture, are roasted by the Africans in iron pots, and eaten by handfulls as sugar-plums. They are said to be very nourishing, and to taste like sugared cream or sweet almond paste. As for locusts, "the Africans," says Dr. Phipson, "far from dreading their invasions, look upon a dense cloud of locusts as we should so much bread and butter in the air. They smoke them, or boil them, or salt them, or stew them, or grind them down as corn, and get fat upon them."—*All the Year Round*.

It is Impossible for editors to know all the merits and demerits of their correspondence, consequently the reader must not receive the opinions of our contributors as our own. Intelligent discussion is invited upon all sides and the evidence of any error which may appear will be received in friendship and treated with respect.

American and Foreign Patents.—Letters Patent for inventions secured in the United States and foreign countries through the Mining and Scientific Press Patent Agency. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past year.

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the Mining and Scientific Press, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

San Francisco:

Saturday Morning, Oct. 22, 1864.

The Importation of Cotton into England, from all sources, at the breaking out of the present rebellion, was about 500,000 tons annually. Since the stoppage of the American importation, the increase from other sources has amounted to fully 50,000 tons, semi-annually. The receipts of cotton in English ports for the present year will amount to about 350,000 tons, exclusive of the contraband trade from this country. That for 1865 will nearly or quite arrive at the highest amount which her importations of this staple reached previous to the rebellion. The rebellion has thus not only put an effectual extinguisher upon slavery, but has also quite as successfully destroyed the monopoly which this country had acquired in the growth of this great staple. American cotton can never again control the market of the world, although for a long time yet its superior quality will probably command for it a higher price than can be obtained for that grown in other parts of the world. Yet, as experiments may demonstrate the adaptability of other regions to its culture, which condition, if coupled with a price of labor at all approaching to that of the East Indies, the slight advantages we possess, at the close of the war, in the culture and exportation of this eminently American staple product, will be destroyed.

Art Union.—The leading artists of this city have held a preliminary meeting for the purpose of organizing a California Art Union. A Committee was appointed to draw up a plan o organization and report at a subsequent meeting. Such an institution would do much in this city to cultivate a popular taste for the fine arts, and encourage those among us who are devoting their time, energy and genius to the production of works in this line which shall be a credit to the State. There is talent enough in the State to ably sustain such an institution if the people will only unite in its pecuniary support. Let us have an Art Union in San Francisco, on the plan of similar institutions in New York, Philadelphia, and other Eastern cities.

A Boy in Search of His Father.—A son of Jonathan R. Dexter, formerly of Mattapoisett, Mass., eighteen years of age, is now in Sacramento, anxious to find his father. The young man, now motherless, last heard from his father, in Sacramento, in 1852. He arrived in this city in April last, having worked his passage around Cape Horn, since which time he has supported himself and made diligent enquiry for his father. Any information intended for him will be thankfully received by Dr. Phelan, at the County Hospital, Sacramento, where the young man is now lying sick.

An awful volcanic eruption has taken place at the Island of Java, rendering a vast tract of land unfit for cultivation for many years. Life and property were sacrificed to an immense extent.

An American pint holds 7,000 grains of water.

EASTERN FINANCES AND TRADE.

Our latest advices from the East are to the 23d of September. At that date financial affairs were assuming a more satisfactory shape. The rapid decline in gold, and the eager bids for Secretary Fessenden's 6 per cent. loan, were features of the market. Gold had fallen 25 per cent in the previous ten days, and a further decline was anticipated. We have since learned, by telegraph, that it did take place, dropping from 200 to 180.

Many causes conduced to strengthen the public confidence in the finances of this country. One cause was, unquestionably, the fall of Atlanta. Even if Richmond is not to be taken this year, the importance of the success obtained by Sherman was deemed so great that everybody seemed to understand and appreciate it. It was thought that as soon as the Secretary of the Treasury succeeded in placing another loan on the market the price of all the prime commodities of life, of which the Government is so large a consumer, would very materially decline. The credit of the United States being strengthened, a large demand from abroad was anticipated for our securities.

It was remarked that while the stock markets in New York and Boston were without animation, and transactions exceedingly limited, Government Bonds were all in favor, and had risen from 5 to 10 ₱ cent.

The following is the comparative statement of the exports from New York (exclusive of specie) to foreign ports, for the week ending Sept. 15th and since Jan. 1st:

	1863.	1864.
For the week.....	$2,637,963	$5,286,408
Previously reported.....	119,047,064	135,461,594
Since Jan. 1st.....$121,685,027		$140,748,002

The following shows the imports of foreign dry goods and general merchandise for the week ending Sept. 15th and since Jan. 1st:

	1863.	1864.
Dry Goods	$1,657,000	$1,587,596
General Merchandise.....	2,015,000	2,313,858
Total for the week.....	$3,672,000	$3,901,454
Previously reported.....$124,339,261		$161,324,638
Since Jan. 1st.....$128,011,261		$165,226,092

The specie exports for the week ending Sept. 15th were..... $425,464
Previously reported..... 32,055,850
Total since Jan. 1st.....$32,481,314

HOME FINANCES.

The money market is abundantly supplied with Capital, and the applications for discount at Bank are lighter than for months past. The rate for most accommodations obtained through regular channels is still 1½ per cent per month, but a number of loans have been made this week by first class institutions at 1¼ per cent on prime securities. The foreign Banks recently established here are glad to get the latter rate for money, and are soliciting good business paper and other collaterals upon more favorable terms than are the older Bankers. The mercantile classes are requiring but little money at present for regular business purposes, and rates of interest, in the absence of an increased demand, are likely to decline.

The receipt of Bullion from the interior and mining district since last Saturday amount to $1,200,000. About $400,000 of this sum has gone into the mint for coinage.

Currency Bills on the Atlantic Cities for the steamer of to-day were current at 90@95 per cent premium on gold. Telegraphic transfers were sold at 5½@6 per cent premium, and drafts payable in coin at 3½@4 per cent.

Bullion was scarce and bars brought 840 @850. Silver was inquired for at ½ per cent premium to 3 per cent discount. Legal Tender notes at the close are selling at 49½@50 and the market is well supplied.

Indian Butchery.—Several shocking Indian butcheries have recently been perpetrated near San Bernardino. A man in charge of the Armagoza mill, at the fork of the Colorado and Salt Lake roads, has been murdered and the mill burned. About twenty miles distant, in a southerly direction, the same party of Indians met and murdered Mr. Joseph Gordon, sheriff of San Bernardino county, and Mr. Plate, formerly of this city. The quartz mill destroyed was chiefly owned by parties in this city.

COPPER AND TIN.

Copper is comparatively a soft metal; tin is still softer. Combine the two together by melting them in the same vessel, and the mass is very hard—much harder than either when taken separately. Again, copper is not one of the very heavy metals, and tin is still lighter than copper. Combine the two, as above, and you have a substance weighing more than both when taken separately. A bell made of copper would sound very dull, one made of tin would sound duller still—in fact it would be utterly devoid of sonorousness; but one made of a combination of the two metals is exceedingly and most agreeably sonorous.

The results of these combinations are very curious, and have elicited much study. The causes of some of the changes produced by chemical attraction between the two, are still involved in mystery. Tin and copper are among the most ancient metals employed by man, and for a long period were of more general application than iron, by reason of the more refractory character of the latter, both in its ore and as a metal. From tin and copper, in all probability, were made the earliest metalic household utensils and implements of war. The "braes" spoken of in the early scriptures, and by the most ancient profane writers, was doubtless an alloy of tin and copper, and not the composition now known by that name. Some of the peculiar chemical affinities of these two metals seems to have been understood at a very early period in the history of the earth, and in many respects probably better than at the present day. The proportion of the metals employed for manufacturing edge-tools has been found, by careful analysis, to be about five parts of copper to one part of tin. The same relative proportion is found in the tools which have been recovered from ancient tombs in Peru, from mines which were worked in Siberia at a period when time was young, and from the famous mines in the island of Elba, whose history had been forgotten even when Virgil wrote. We are not aware that any other metals can be so combined as to produce so complete a destruction of the former properties of either of the constituent parts. This change of properties is produced by "affinity," a principle common, in a greater or less degree, to all bodies when brought into a state of chemical combination. Of this principle we may have more to say at some other time.

The Golden Era.—We would call the attention of all newly-arrived Californians to the advertisement of this excellent weekly cotemporary, which appears in another column. We have seen the Era so frequently at the family fire-side and in the rude cabins of so many industrious miners that it would seem superfluous to recommend it to old Californians. It is the oldest literary journal on the coast, having stood the contest of competition with many excellent and worthy cotemporaries during the past twelve years. The present proprietors, Messrs. Brooks & Lawrence, having ably earned their success with the Era, are deserving of the extensive patronage the paper is receiving, as a popular journal for the general public.

The English after all appear to be catching the bird in the Mexican bush, which the French have so long been beating. The latter nation are humiliated at seeing the English take possession of Mexico with their money, as soon as the new French empire is established. The English have taken the contracts for the new railroad system of the country; the English merchants have already forestalled the markets with the products of English manufactures, and will doubtless forestall the French in getting possession of the most desirable mines.

It is said that government will derive three and a half million of dollars of revenue, the present year, from friction matches.

California Champagne.—The San Francisco *Mercantile Gazette* says that California champagne at $10 a case is superior to the imported article for which $20 is demanded.

Arrival of the Wateree.—This long expected gunboat made her appearance in our harbor, at an early hour, on Sunday morning last, and after steaming around the bay took her departure for naval headquarters, at Mare Island, to attend to any repairs that may be necessary, and report for duty. The Wateree is a side wheel steamer, with two masts and two pilot-houses. Her hull is so divided into water-tight compartments that she might be pretty well riddled and still be kept afloat. She is about 1,000 tons burthen, and carries eight heavy guns on her main deck. She has been 222 days on the trip; much of that time, however, has been spent in port. The Wateree is of a peculiar model, sharp, and with steering apparatus at both ends, and so arranged that she can run backward with as much facility as forward, a feature that, in action, gives her a vast superiority over the ordinary model, where manœuvres are to be accomplished with promptness.

Singular Occurrence.—Quite a singular accident occurred near Geneva, New York. It appears that a gentleman was riding along the road past a garden in which were a number of bee-hives, which, by some accident, just at that moment were overturned. The bees instantly made a furious attack on the horse and his rider. The horse could not be urged forward, and was left to his fate; while the rider, who was thrown at the first, ran along the road for half a mile, scraping the bees from his face in handsful, and crushing them in his agony, when a man seeing his condition, rushed out of a house and threw a quilt over his head, upon which the bees left. The unfortunate gentleman immediately washed himself with salt and water, and also drank freely of the liquid. He then went back and found his horse rolling and kicking in great agony, and notwithstanding all that could be done, he died soon. The gentleman believes that the free use of salt and water, and the subsequent liberal use of whisky, was all that saved his own life.

Another Explosion—One Life Lost.—The steamer Amelia collapsed her steam drum on Monday last, while on her way from Napa to this city. One of the firemen was so badly scalded that he died in about three hours. The steam fortunately escaped through the smoke stack; had it have been otherwise, the accident would have been calamitous in the extreme, as an unusual large number of passengers were on board. For a short time after the explosion the alarm and confusion among the passengers was very great, the noise of the rushing steam being highly suggestive of danger, and the officers with difficulty convinced them that such was not the case. The disabled steamer was overtaken and towed to this city by the Chrysopolis.

Spontaneous Combustion.—The Virginia *Union* says that there was "almost an alarm of fire" in Virginia City on the 12th inst., caused by the spontaneous combustion of certain chemicals in a trunk at Vance's photograph rooms on D street. The contents of the trunk were entirely destroyed and a hole burnt through the floor where the trunk stood. It was discoved just in time to prevent any further damage.

A Much Needed Improvement.—Sidewalks, nineteen feet wide are to be laid down in Brannan street, from Third to Ninth, as soon as the San Jose Railroad company shall have fulfilled their agreement to grade that street. It should be made somebody's business to see that the obligation on the part of the Railroad company was fulfilled.

A Novel Squirrel Trap.—The Contra Costa *Gazette* has seen a novel squirrel trap, the invention of a Mexican boy ten years old. It is a common ox horn, with a strongly twisted horse hair loop fixed in the end. The whole concern is staked firmly to the ground, and grain placed in the horn, tempts the animal to venture in. That is easy enough, but on backing out the loop takes him sure. Seven squirrels and a skunk were the results of the first day's trial. The boy wants to sell traps at $10 per hundred.

ELECTION OF OFFICERS.

ÆTNA G. & S. M. Co.—Meeting, Oct. 17th. Trustees: Simon Mayer, Henry Dresehfeld, I. Louis Sehrœder, George Treat and J. R. Smith. President, Simon Mayer; Secretary and Treasurer, Hugo Dresehfeld; Superintendent, E. O. Taylor.

BOSTON C. M. Co.—Meeting, July 6th. Trustees: H. H. Bigelow, W. O. Andrews, J. Preston Moore, Thos. Davidson and Charles Laton. President, H. H. Bigelow; Secretary and Treasurer, J. C. Hutchinson; Superintendent, Daniel McCarty.

CHIPONENA M. Co.—Meeting, October 10th. Trustees: G. Touchard, G. H. Howard, F. E. Lynch, H. F. Teschemacher, J. Mosheimer, F. Roeding and J. Caire. President, G. Touchard; Secretary, John F. Lohse; Treasurer E Berri; Superintendent, F. Bonacina.

COSALA S. M. Co.—Meeting, September 19th. Trustees: H. H. Toland, J. D. Thompson, C. Baum, W. R. Allen and John Wright. President, H. H. Toland; Secretary, A. F. Durney; Treasurer, W. W. Coghill.

DIOS PADRE G. & S. M. Co.—Meeting, Oct. 3d. Trustees: Ira P. Rankin, S. B. Whipple, F. Shoekley. President, Ira P. Rankin; Secretary, E. C. McComb; Treasurer, John Sime.

EL TASTE S. M. Co.—Meeting, Oct. 18th. Trustees: J. B. Roberts, J. O. Rountree, F. D. Carlton, B. E. Harris, J. R. Mead, C. Wittram and A. F. Sawyer. President, J. O. Rountree; Secretary, E. C. McComb; Treasurer, F. D. Carlton; Superintendent, W. H. Moore.

GREAT CENTRAL M. Co.—Meeting, Oct. 10th. Trustees: Chas. L. Wiggins, A. S. Evans, J. Carroll, John R. Mason, W. R. Satterlee, S. S. Tilton and Wm. Thompson. President, Chas. L. Wiggins; Secretary, Richard S. Clark; Treasurer, Wm. R. Wheaton; Superintendent, Wm. Thompson.

LA CHUREAS S. M. Co.—Meeting, Sept. 14th. Trustees: H. S. Ackermnn, R. Wertheman, John Winter, F. Schumacher, M. Homberger. President (pro tem.), R. Wertheman; Secretary, A. Mareus; Treasurer, R. Wertheman.

NOBLE GRAND M. Co.—Meeting, Aug. 31st. Trustee: John Kelsey. President and Treasurer, W. H. Baxter; Secretary, A. G. Wood; Superintendent, D. Witter.

PLANET C. M. Co.—Meeting, May 2d. Trustees: S. J. Ashley, Wm. Patton and Jas. McNamara. President, S. J. Ashley; Secretary, J. C. Hutchinson; Treasurer, M. M. Baldwin; Superintendent, R. Ryland.

SAN FRANCISCO MOSS LEDGE Co.—Meeting, Oct. 15th. Trustees: George Hearst, Silas A. Stone, F. L. A. Pioche, John Nightingale, W. T. Coleman. President, George Hearst; Secretary, Robert T. Polk; Treasurer, F. L. A. Pioche; Superintendent, Wm. France.

SANTA CRUZ PETROLEUM OIL WORKS Co.—Meeting, Sept, 27th. Trustees: Leander Ransom, Isidor Landsberger, Wm. Neil, A. B. Stout and M. C. Walton. President, L. Ransom; Secretary, J. A. Rawson; Treasurer, Isidor Landsberger.

SMITH & MARTIN G. & S. M. Co.—Meeting, Sept. 20th. Trustees: Horace Morrison, P. B. Cornwall, Wm. T. Coleman, Henry B. Williams and George Platt. President, Horace Morrison; Secretary, Robert T. Polk; Superintendent. F. A. Prescott.

SOPHIA G. & S. M. Co.—Meeting, Sept. 5th. Trustees: Isaac S. Josephi, A. Unger, H. Loewy, J. E. De la Montagnie, W. Fisher. President, Isaac S. Josephi; Secretary, David E. Josephi; Superintendent, Chas. Sell.

WAITT CONSOLIDATED G. & S. M. Co.—Meeting, Oct. 10th. Trustees: Wm. H. Culver, C. E. Woodbury, Wm. N. Shelley, Daniel Waitt, Jr., and Andrew S. Young. President, Wm. H. Culver; Secretary, George R. Parbnrt; Treasurer, Calvin E. Woodbury.

HON. JOHN CONNESS left this city for his post at Washington, by the steamer Moses Taylor, on Wednesday last. Congressman Shannon also left upon the same steamer.

THERE is nothing new under the sun, and whenever anybody says a good thing, let him reflect on the strong probability there is that somebody else has said it before.

MECHANICS' INSTITUTE INDUSTRIAL FAIR REPORTS.

MINERALS AND MINERAL PRODUCTS.

SAN FRANCISCO, October 15th, 1864.

JOSEPH BRITTON, ESQ., President of the Mechanics' Institute.

SIR:—As a member of the Committee of Award upon "Minerals and Mineral Products," Class XVII., of the late Industrial Exhibition, I send you the following notes upon the contributions in that department. As I did not meet or see any of the other members of the Committee, I am only able to present this report individually, and not in the name of the Committee. Respectfully yours,

WM. P. BLAKE.

Although no special effort had been made to secure a representation of the mineral resources of California and the adjoining States, the contributions in the department were more numerous and varied than visitors generally supposed, and although a fractional and disjointed representation of California resources, was nevertheless of considerable importance and interest. Twenty-four entries are found in the catalogue; but there were other contributions not enumerated. The following are brief notices of the most important contributions, including those of manufactured products:—

Coal.

99.—B. H. Ramsdell, San Francisco, Three specimens of coal from the Black Diamond mines, Mt. Diablo, Cal.

These specimens were remarkable for their size and purity. One mass from seam No. 1 was five feet long and two feet by three square, and weighed 1,730 pounds. The mass from seam No. 2 was about six feet long and three feet by three feet square. It represented the whole thickness of the seam. Seam No. 1 is five feet ten inches thick, and No. 2 is twenty-eight to thirty-six inches thick.

The production of the Black Diamond Coal Company's mines, for the past three years, has amounted to 37,000 tons. The average production is 70 tons a day. There are five different mines now working, and with about the following production per day for each:

Black Diamond Mine	70 tons
Union	40 "
Eureka	20 "
Manhattan	20 "
Pittsburgh	30 "

Or 180 tons for all the mines per day, or 5,400 tons per month. It is carted to the San Joaquin river, to the place known as the New York of the Pacific, where it is shipped to San Francisco and other places. The expense of transportation to this city from the mines is $3.50 per ton. It sells at from $7 to $9 per ton by the cargo, according to quality. It is used chiefly by the river and coast steamers. The sugar refineries consume about 150 tons of the Black Diamond coal per week. It is sold at retail to families for $12 per ton. With a railroad from the mines to the landing—which, it is estimated, may be built for $80,000—this coal can be sold in San Francisco for $7 per ton.

Iron.

103.—Governor A. C. Gibbs, Oregon, One specimen of iron ore, 16 miles from Portland.

This specimen, as I learn from a label attached, is from an "extensive bed." It is the variety of iron ore known as "limonite," and is apparently of excellent quality, suitable for making pig and bar iron. It is porous, and is without any visible mechanical impurities. It should contain about 50 per cent. of metallic iron, and may become of great value as a source of iron for this coast, especially if upon water navigation and near coal and limestone.

Copper and Its Ores.

384.—John Simms, Copper ore from the Fall Creek lode, Josephine county, Oregon.

A fine mass of nearly pure yellow sulphuret of copper, fifteen inches long and eight inches thick. Contains about 25 per cent. of copper.

643.—W. G. Moody, San Francisco, Copper ores from Nacosari District, Sonora, Mexico.

These contributions consist of large masses of variegated sulphuret of copper, known among the Cornishmen as "horse-flesh ore." The working results of the ore are stated as 48 per cent. of metallic copper and $63 of silver per ton.

180.—M. G. Elmore, Table Mountain Copper Mining Co., Copper ore.

This is a very fine mass of yellow ore, weighing 600 pounds, taken out 150 feet from the surface. Assay value, 23 per cent. The mass is about three feet long and two feet wide, and is nearly pure. The company is "shipping from 60 to 100 tons a month," and developing the mine.

Union Copper Mine, Del Norte county, Cal.; Kruse & Euler, San Francisco.

A large mass of copper ore from this mine, weighing 1,060 pounds, and containing, according to ticket, 33¾ per cent. of copper, 2 ounces of silver and ¾ of an ounce of gold, and with a total value of $116.44. This was presented to the California Branch of the U. S. Sanitary Commission.

Francois Genard, San Francisco.

A series of crucible buttons, exhibiting the various stages of production of copper from the ore by fusion in crucibles. The series contains black copper, the slags, the results of second fusion, and the refined copper.

J. T. McDougall, San Francisco, One bag copper ore; five bars of copper.

These bars of copper are claimed to have been produced at one operation by the exhibitor, under a patent dated March 29, 1864. There was no opportunity to examine the operation.

470.—Eliza J. Hall, "Copper ingot smelted in the patent volcanic smelting furnace."

C. E. Johnson. Specimen of metallic copper obtained from carbonates and oxyds in one hour, from the ore, by a new process.

350.—Henry R. Reed, Treasurer Cordillera Co., San Francisco, Silver and copper ore and ingots from the Santa Barbara Mines, Chihuahua, Mexico.

The ore in this collection is, apparently, vitreous copper. The two ingots are said to be the product of 300 pounds of unassorted ore.

Silver.

737.—Maria Silver Mining Company, San Antonio, Lower California.

A fine mass of silver ore, 18 inches long and about 12 broad, nearly pure, but with a few patches of zinc-blend interspersed.

814.—Samuel Pillsbury, Silver ore from La Libertad mine, Cacachillas District, Lower California.

This is a fine mass of ore, "Colorados," from near the surface, showing the various colors due to the decomposition of the silver and copper minerals of the vein. It has a vein-stone of quartz.

L. Leland, Specimens selected from the Occidental Hotel cabinet.

A glass case, containing about 100 specimens from various mines in California, Washoe and Arizona. It is by far the choicest general collection of the Exhibition, and contains specimens from the Gould & Curry and other ledges on the Comstock, from the Moss Ledge, from the Union copper mine, and others not otherwise represented in the Exhibition. Mr. Leland, in providing a suitable place for the reception and display of mineral specimens, has done a public service and secured a magnificent cabinet.

Gold.

744.—Melones and Stanislaus Mining Company, Calaveras county, Cal., G. Congdon, San Francisco; Three specimens of gold and silver ore.

These are splendid specimens of quartz vein-stone, charged with massive gold, intermixed with a telluric mineral, probably tetradymite. They are taken from the Stanislaus mine, about one mile south of Carson Hill, at Robinson's Ferry. They were obtained at a depth of over 200 feet from the surface. The vein varies from six to eighteen inches in thickness, and is sometimes divided up into four or five parallel sheets in the slate. The slate near the vein is found to be impregnated with gold. The tellurium has been traced downwards from the surface, and at times has been abundant, and furnished some choice cabinet specimens of this rare combination. The mineral differs from that of the Fields vein of Georgia, where remarkable masses were found, in its color, and in not being foliated. The selected rock from the vein is sent down to San Francisco, to be smelted by Kellogg & Hewston. Advances can be had upon it to within ten per cent. of the fire assay. The vein was discovered in 1850, and has always had rich pockets. It is in the vicinity of the celebrated Morgan and South Carolina mines.

789.—H. W. Williams. Whisky Hill Mine, Tuolumne Co., Gold specimens.

A suite of remarkably fine gold specimens in quartz, with numerous flattened, distorted octahedral crystals. There are several irregular plates, with numerous crystalline projections—the solid angles of crystals. These specimens much resemble some formerly obtained from the Gold Hill vein of Grass Valley.

500.—Blue Mountain District, Calaveras county, Cal., Gold and silver ore from the Beckendorf, Celina, Star of the West, Loyal League and Gold Hunter companies.

These ores are all similar, consisting of argentiferous galena, pyrites and probably free gold, spread through quartz. If there is an abundance of such ore, it could be profitably crushed and concentrated for shipment to smelting works.

881.—J. F. McDougall, for Siskiyou Mining Company, Siskiyou county, Cal., Gold in quartz.

Numerous very rich specimens of gold protruding from the vein-stone.

Salt.

W. R. Winegar and Son, Specimens and samples of salt from various localities.

1. Rock Salt from Lower California—white crystalline crusts one and two inches thick. 2. Coarse salt from Carmen Island. 3. Coarse salt, Lower California. 4. Rock salt in large clear crystals, transparent, and remarkably dry and pure—from Virgin River, Arizona Territory.

A. B. Winegar, Union Salt Works, 322 Front Street; Samples of ground rock salt, dairy salt, cooking and table salt, in five, ten, twenty, and fifty pound sacks.

The samples of table salt exhibited are of excellent quality, being white, dry and fine, and whiter than the Pembroke table-salt shipped to this port from Boston. It is made from coarse, clear crystals of San Pedro rock salt, kiln-dried and ground.

Of the rock salt, that from San Pedro appears the best. An article that compares favorably with it, and with the Carmen Island salt, is made on the shores of the Bay of San Francisco, near Union City. The crystals are of medium size, sharp and clear. Some of the salt from that vicinity in crystals of about the same size, is milk-white, and attracts moisture more rapidly. It contains more impurities, and is inferior in quality to the clear crystals. The exhibition of this firm contains a greater variety of samples than the others, and a superior article of table-salt, worthy of a premium.

Barton & Brother, Pacific Salt Works, 218 Sacramento st. Dairy salt in fifty pound sacks.

A very fine article of dairy salt, ground, and both white and dry.

A. Georgiani, Trapani Salt Works, Mt Eden, Alameda County, California, and 421 Davis street, San Francisco, Rock salt in half formed, irregular crystals, but very white, but quite dry.

Plummer & Co., Crystal Salt Works, Alameda County, Table and dairy salt; also, rock salt and blown salt.

These varieties of salt are manufactured by solar evaporation from the water of the bay at the eastern side. The sample of rock salt is of excellent quality, being apparently quite dry, and in well formed cubical crystals, clear and clean. The "blown" salt is a superior article, approaching in character to the Liverpool salt, for which it might advantageously be substituted. The grains are remarkably clean and even, and the crystals are well formed. It is made by the action of the wind upon the concentrated brine, and as rapidly as the crystals form upon the surface they are blown to the edge and thrown up in ridges on the shore or upon platforms made to receive them. A premium for this variety is proposed.

The supply of salt for California is obtained from Liverpool, Carmen Island, San Quentin, Lower California, San Pedro, and the Bay of San Francisco. At all these places, except this first, it is prepared from sea-water by solar evaporation. It is estimated that over 15,000 tons of salt will be manufactured on the eastern side of San Francisco Bay, this year; the season has been extremely favorable, and the duties on foreign salt are now so high as to stimulate home production. Imported salt pays a duty of $4 80 per ton. Manufacturers or producers of salt within the limits of the United States, pays a duty of $1.20 per ton. Liverpool salt sells in this market for $25@$30 per ton, according to its quality. Carmen Island salt sells at $18, and the best bay salt for $10 per ton. The examination of the various samples, and products in bulk, shows conclusively that there is not sufficient reason for this great difference in price or value. The ground rock salt made in this State, when well made, is of excellent quality. With the superior advantages which this climate offers for the manufacture of salt by solar evaporation, salt equal to any can be produced in unlimited quantities, and there is no reason why the home article should not entirely displace that of foreign production. The samples of rock salt from San Pedro and the bay show that such a result can not long be deferred. Already, for ten miles along the eastern shore of the bay, salt works are established, at intervals, and their number is increasing. France and the countries bordering the Mediterranean, are supplied in a similar manner, by solar evaporation. Fortunately for the interior of Nevada and Arizona, there are extensive salt-beds at intervals over the surface, from which the numerous silver reducing establishments are supplied.

Miscellaneous.

California Borax Company, Samples of native and refined Borax from the borax lake in Lake County, California.

Refined borax from the above locality has been introduced into this market within the last year, and being of a superior quality and cheaper, and of home manufacture, is preferred by the consumers. Large amounts are used by the bullion smelters and refiners. It is made by re-crystallization from the native borax found in crystals in the mud at the bottom of a lagoon. These crystals are remarkable for their size and perfection, some of them being four or five inches long, and having very perfect faces. As inaugurating a new industry and supplying our market with a superior article of home production, this enterprise deserves the highest premium in the award of the Institute.

327.—George S. Dickey, San Francisco, One case of Monsel's Salt.

A very fine and complete exhibition of all varieties of this valuable therapeutic agent, in scales, in powder, and in solution, showing great skill and nicety in making pharmaceutical preparations, of which this is one of the most difficult. It is a per-salt of iron possessing remarkable hæmostatic properties, first made known by M. Monsel, of the Military Hospital, Bordeaux, in 1852. Its action on blood and albumen is peculiar, producing coagulation without any caustic or irritant effect on the tissues. It has been used with great success in stopping hemorrhage where other styptics have failed, and where ligatures would otherwise have been required.

This preparation was first made in California by Mr. Dickey, in 1858. It is singular that it was found difficult to prepare an article of equal purity and excellence in the Atlantic States. Samples sent from this city were repeatedly pronounced superior to any that could be obtained there. An eminent practioner found it necessary to send here for a supply, for the so-called Monsel's Salt made at the East would not produce the effect ascribed to it by M. Monsel and surgeons in that city. The salt, as shown by Mr. Dickey, is in light, thin scales, of different sizes and thickness. They are translucent, of a light reddish brown color. These are produced by evaporating the solution to a thick syrup and cooling it on glass plates, from which it is afterwards detached by chisels. A premium should be awarded to this exhibitor for a superior article of Monsel's salt, showing rare pharmaceutical skill in its preparation.

Pacific Metallurgical Works, Case of specimens of ores from various localities, and a sample of fire-proof paint.

The last mentioned article is prepared from the high-colored residues from the working of ores, and contains numerous metallic oxyds. It has a chocolate red color, due to the predominance of oxyd of iron, and when mixed with iron forms a cheap paint for rough outside work. The manufacture of cheap paint is beginning to attract some attention in this city—a mill having recently been started to prepare various grades of mineral paint from the oxyd of iron and manganese found in seams or layers in the rocks of Red Island.

James Patterson, Placerville, El Dorado county, Cal.

This exhibitor sends pen and writing-stands and match-stands, manufactured by him from a steatite, soapstone, obtained near Placerville. These objects, when covered with a coat of varnish, greatly resemble serpentine or verd-antique, and are very attractive in their appearance.

Terra-cotta ornaments, San Antonio, Alameda county.

A very fine exhibition of architectural ornaments, which commend themselves to builders by their excellence in design and their superiority to plaster or wood in resisting the weather. Deserving of a premium.

H. Herzer, Kearny street, San Francisco, Muffles, crucibles and scorifiers, made in this city, from California clay.

In form and appearance these samples seem quite equal to those imported from France, and they are sold at lower prices.

Recapitulation of Recommendations for Premiums.

California Borax Company, For superior borax of California manufacture. Highest premium.

George S Dickey, San Francisco, For a superior article of Monsel's salt, showing great pharmaceutical skill.

A. B. Winegar, Union Salt Works, For the best display of salt, and for the best article of table salt, made from California rock salt.

Plummer & Co., San Francisco, For a fine article of blown salt, made in Alameda county.

San Antonio Pottery, Alameda county, For display of terra-cotta ornaments.

H. Herzer, San Francisco, For crucibles, muffles and scorifiers, for assayers' use, made of California clay.

BRAVE AND COURTEOUS.—The last act of Capt. Craven, who went down in the monitor Tecumseh, during the attack on the Mobile forts, was a notable instance of sublime courtesy. As the pilot and himself, the last in the vessel, moved to the ladder, the captain stepped aside, saying, "You first, sir." The pilot was saved, and the hero perished in his magnanimity, an example as noble as Sydney's.

ANOTHER IRON VESSEL.—A neat and trim looking clipper ship, called the Viscata, is now in this port, and lying at Greenwich Dock. She is built of iron, her lower masts and spars are of the same material, and her stays are of wire rope.

Plumas County.

Eds. Press:—Having been in this locality but a short time, I am not able to give you so extensive an account of this rich mining district as I propose doing after a more thorough examination of its capacities, yet I will proceed to give you a slight sketch of what has thus far fallen under my observation.

Having some unemployed time on my hands, I accepted an invitation from Mr. H. C. Bidwell to take a trip through the mountains surrounding the beautiful and extensive valley known as Indian Valley, for the purpose of examining some of the many rich lodes of gold bearing quartz located in that section.

The first claim we entered was the Wiles claim, situated in Round Valley. This company have worked down about sixty feet, hoisting the rock with a whim, and are now taking out about eight tons per day of pay rock. The quartz looks well, and, as I am informed, will yield an average of twenty-five dollars per ton; they employ five or six miners at present, but propose soon to increase the number. There are several other claims being worked in Round Valley, but want of time prevented me from taking anything more than a passing glance at them. I would here mention that I find more or less copies of the Press in every little mining camp, but if I chance to find a place without it, I seldom fail of obtaining orders to send it along, which is sufficient evidence that the miners in this county are not behind the age in their desire for useful scientific mining information, such as your paper alone can afford them.

The next claim visited was the McLellan, situated about two miles from Greenville, on the east side of the same range in which the Wiles ledge is located, and about fourteen miles from Taylorsville. The McLellan is owned principally by Messrs. Bidwell and Waterworth, of this county, and F. Ogden, of your city. Before entering this mine I took from a car that was passing out, a horn full of decomposed and seemingly barren quartz; on washing it I was most agreeably disappointed, and at once form a favorable opinion of the mine. On entering the tunnel my attention was at once attracted to the fine timbers that are put in for supporting the roof; this is as it should be, and I think too much attention cannot be given to the selection of the timbers used in mining operations. This company have already extracted a large quantity of pay rock, and I am informed that they have now in sight enough to keep their mills running two years, and at the distance of one hundred and ninty feet from the mouth of the tunnel, and ninety feet in depth, their ledge is full three feet in width—certainly an encouraging sight for the owners. Under the superintendence of Mr. Bidwell they are taking out twenty-five tons of pay rock per day, which, on being hauled to their mills and crushed, yields an average of fifty dollars per ton. I have seen a clean up of fifty tons of this rock, and can state from actual observation that it is rich, and a few more such ledges are yet left. All that this county wants is a few more actual workers to develope its resources.

The next claim we came to was the "Right Stripe," which I think is well named, as they have plenty of rock in which free gold is readily seen with the naked eye. It has every appearance of being just as good as the McLellan, and I think a rich reward awaits its energetic discoverers. These few were all the ledges that I had time to visit on this hasty trip, but if nothing prevents, I will soon give your readers an account of the Crescent and other good claims in that vicinity.

COPPER.

I made a visit to one copper claim, situated about one mile and a half from this place. It is called the Montgomery ledge, and has all the indications of becoming a good paying claim, although not yet prospected thoroughly. Native copper can be seen in much of the float rock, and also yellow and black sulphurets with native copper, in rock taken out at a depth of fifty feet, that being the greatest depth that has yet been attained. As work progresses on this claim, you will hear further from it.

THE FAIR.

has been quite a success in Plumas, this year, even beyond the expectation of the most sanguine. It was held in Quincy, the county seat, and the agricultural interests of the county were well represented, one section trying to excel the other in its display of vegetables, grain, &c. One of the most attractive of the articles exhibited, was a portrait in worsted work, of George Washington, life-size, by a young lady. The cattle fair was not quite so good, and indicates a lack of interest in the improvement of their stock through the importation of blooded animals. Some very good horses were exhibited, among them a fine two year old, raised by a Mr. Thompson. As I was unable to remain at Quincy during the whole of the fair, I can give you but little account of it, but those of your readers who are interested in such matters may obtain full particulars from the Quincy *Union*.

TRAVELER.

Taylorsville, Plumas county, Oct. 10th.

INTERESTING FOSSILS.—At a meeting of the members of the California Academy of Natural Sciences held on Monday evening, Mr. Clayton, a member who has recently returned from an extensive exploration of the Territory of Nevada, presented the Society with a number of rare fossil teeth, found in the valley of Walker's River, in that Territory, including those of the fossil elephant and of an extinct variety of the horse. The California Academy of Sciences have the finest collection of fossils and minerals to be found in any State in the Union, but, for want of a suitable place to exhibit them, all the benefits to be derived from such an important aid to geological and mineralogical discovery are lost to the people of the State.—*Flag.*

STILL IMPROVING!

VOLUME IX

—OF—

The Mining and Scientific Press

COMMENCED

ON THE FIRST OF JULY, 1864,

WITH

An Enlargement of Its Pages.

Sixty-Four Columns in Each Number.

PUBLISHED EVERY SATURDAY.

THE PROPRIETORS of this useful and now important journal experience much satisfaction in returning acknowledgements to their ardent friends and rapidly increasing patrons who have substantially contributed to the remarkable success of the PRESS during the past six months. By aid of the ACCUMULATING PATRONAGE now being properly bestowed upon the

ONLY TRUE MINING AND MECHANICAL MEDIUM

Upon this Coast, we are enabled to prove our appreciation of such marked favor by rendering the public one of the

Largest, Handsomest and Most Useful

Journals now published. With this view we shall exert our best energies, and continue to make the MINING AND SCIENTIFIC PRESS substantially

An Instructor to Prespectors,
An Economist to Millmen,
An Assistant to Active Miners,

An Economizer for Mining Advertisers,
A Reliable Reporter for Shareholders.
A Faithful Monitor for Stockdealers,

An Intelligencer for Mechanics,
An Incentive to Inventors,
A Reflector for Patentees,

And a Helpmeet to all Industrial Classes,

In fact, upon the Pacific Coast. We shall give accurate and frequent

DRAWINGS AND ILLUSTRATIONS

Of new inventions and discoveries of particular value to Miners, Mechanics and Manufacturers, their interests in this communlly being well considered "one and inseparable."

THE SHAREHOLDERS' DIRECTORY

Will comprise a record of all Notices of Meetings of Mining Companies, Notices of Assessments, amounts levied, date of advertising sales, and day of sales, announced in all advertisements appearing in the San Francisco papers during the period of the Volume.

STATISTICS FOR REFERENCE

And Reports of Elections of Officers of Mining Companies, Stock Reports, Valuable Tables, etc., will be continued with careful attention.

OUR PATENT AGENCY

Is increasing in importance and value to the Inventors of the Pacific Coast, as many Patentees can testify from their successful applications through us during the past twelve months.

FOR SENDING ABROAD.

As a paper for mailing regularly to your friends in the East, or to correspondents elsewhere, none can be selected more appropriate, or better calculated to dispense reliable information with regard to transpiring events on this coast and the progress of California.

Specimen copies will be sent free to those desiring to examine the paper before subscribing. Postmasters, Express Agents and News-dealers, acting as our agents, will receive liberal commissions.

Friends pleased with our efforts in the publication of the PRESS can render us essential aid by furnishing correspondence and all important information which may come under their observation, and by calling the attention of their neighbors to the commendable features of the paper; the appreciation of which favors will be duly manifested by the constant improvement of our journal.

SUBSCRIPTION IN ADVANCE.

One Year, (two volumes)..... $5.00
Six Months, (one volume)..... 3.00

FOR ADVERTISING

Our terms are very reasonable. MINING COMPANIES are especially favored by our rates, and careful attention is given to the publication of MINING NOTICES.

OFFICE in Government House, Nos. 56 and 57, corner of Washington and Sansome streets, San Francisco.

DEWEY & CO., Publishers.

C. W. M. SMITH.....W. B. EWER.....A. T. DEWEY.

For Sending East, no more valuable or appropriate publication can be selected than the MINING AND SCIENTIFIC PRESS. For sale by the principal news agents.

MINING SHAREHOLDERS' DIRECTORY.

List of Notices of Meetings, Assessments and Delinquent Sales.

Comprising the Names of Companies, District or County of Location, Amount of Assessment, Date of Meeting, Delinquent Advertisement and Sale, and the Place of Business of the Corporation if it is not in San Francisco.

REVISED EVERY ISSUE.

Advertised in the Mining and Scientific Press AND OTHER SAN FRANCISCO JOURNALS*.

[The mining community begin to appreciate our reasonable rates of advertising, and are turning their patronage to the journal most properly entitled to receive it. The advantage to shareholders of having all mining notices concentrated in one mining journal, is obvious to all, and our terms have been established with a view to affect such a consolidation; and most companies having an object for publishing in any other particular paper, can consequently afford to have their notices appear in our journal also—EDS. PRESS.

Cottage Wanted.

A COTTAGE, or small tenement, is wanted for a man and wife, near a city railroad, in a pleasant and healthy location. A permanent home is desired. Inquire at this office, No. 11 Government House. 17-1f

COTTON SUPERCEDED.—"Spiral spring bosom pads," a new article, and an improvement on India-rubber and cotton, has recently been introduced for the benefit of the ladies.

G. F. DEETKEN,
MINING ENGINEER.
HAVING DISPOSED OF MY INTEREST IN THE DEETken & Co. Metallurgical Works, on the San Bruno Road, I offer my services to the Mining Community, to Superintend the starting of new Mills, to report upon Mines, and furnish correct Surveys and Maps thereof.
Drawings of Mining Machinery executed in the best style of the art. Small lots of Gold and Silver Ore Reduced carefully by the best known methods.
My old friends are respectfully invited to continue the patronage which I have enjoyed in this State the last ten years. Parties wishing to communicate, can do so through J. W. McKenzie, No 406 Montgomery street. 15-tf
San Francisco, October 1st, 1864.

BOOKKEEPING.
YOUNG MEN CAN ACQUIRE A COMPLETE BUSINESS Education by taking a course of Bookkeeping and Commercial Calculations at the Counting rooms of Prof. Lorr, 305 Montgomery Street. The course of study prescribed for his students is more extensive and thorough than any other in the city. Penmanship taught on the Spencerian system. Charges reasonable. 7-2m

Evening Instruction in Anylitical
Chemistry and Assaying,
Conducted by Thomas Price.
(Agent for the Swansea Ore Importers in California.)
HAVING FITTED UP A LABORATORY ESPECIALLY for instruction in Analysis and Assays, the subscriber begs leave to announce that
A NEW CLASS WILL BE FORMED
On the 1st of June. For terms apply at the Laboratory, on the evenings of Tuesday and Saturday at 7 o'clock; or at the office of the "Pacific Mineral Company," Odd Fellow's Hall, Montgomery street. THOMAS PRICE.
San Francisco, May 10th, 1864. 20

THEODORE KALLENBERG,
Maker of Models for Inventors.
MACHINES, MATHEMATICAL, OPTICAL AND PHILOSOPHICAL Instruments, Scales, Weights, etc. Steel Stamps, Dies and Die Sinking, Embossing Stamps. Repairing of machinery promptly attended to.
No. 418 Market street, San Francisco. n7-tf

Personal.
THE JOHN McCOMB OF THE "ARGUS" NEWSPAPER, is not the undersigned, who has no taste for publishing that kind of a sheet. During my fifteen years residence in California I have always been identified with the the Printing business, and many of my friends have made the natural mistake which I find necessary thus to correct.
JOHN McCOMB.
16-3t* Foreman "Alta California" Office.

SCIENTIFIC AND MINING JOURNAL.—This is as valuable a publication as is produced on the Pacific Coast, and one which interests all parties. It contains much that is instructive and entertaining, and seems to have the right men at the head of its affairs.—*Spirit of the Times.*

The Mines of Humboldt.

Under the above head a writer in the Daily *Alta*, who is intimately acquainted with the mines of Humboldt, gives the following interesting facts, which we have slightly condensed :—

The Sheba, located in Star District, the ore of which is intermixed so much with base metals, such as lead, antimony and copper, as to have prevented satisfactory results from the ordinary process of amalgamation. This Company have completed the best mill in Humboldt county, in connection with which are furnaces for roasting the ores; and from experiments already made, the result is highly satisfactory.

Upon this mine a large amount of work, such as tunnelling, has been done, and numerous galleries have been made, exposing to view a vast amount of rich ore. Several hundred tons of ore were at the mine, at the date of the completion of the mill. In all of the other districts as a general thing, the ore is of an entirely different character from that of the Sheba or De Soto, which I consider one and the same lode. Instead of being composed of base metals, and requiring rousting before amalgamation, in very many instances the ore from the other mines now opened has but sufficient base metal to cause them to work with ease and extraordinary good results.

The "Evening Star," located in Trinity district, seven miles from Humboldt river, sent to San Francisco two tons of ore, which produced $314 per ton. Within the past three months, the company ordered the superintendent to send to Fall's mill, at Unionville, a few tons of this ore to further test its value and working qualities. The first shipment, of two and and a half tons, produced $400 per ton; the second of two tons, at the rate of $412. The mill at which this ore was worked, is a small, four-stamp, water-mill, with the Douglas pan; in fact everything about this mill is of the old style, such as was used at the commencement of the silver mining in Nevada territory. Now, if three years' experience in mining has produced more perfect machinery, or an improved method of amalgamating, why have we not reason to suppose this same ore, worked under this system of improvement, should not produce a much greater result?

The ore above mentioned, was worked, with little selection, as it came from the mine, and while the result should be satisfactory, the writer is positive the same ore, worked by the pans, and treatment more recently put to use, would produce not less than from five to six hundred dollars per ton.

The Atlas Company, located at Unionville, had ten and one-fourth tons of ores worked from their lode, with a result of something more than $300 per ton. This ore was worked at the same mill at Unionville, and while being taken from the mine the writer was present, and has no hesitation in saying there was not left three hundred pounds of rock, as rejected at the mine.

East Range. In what is called the East Range, are located the Gem, Tallula, Natchez, and many others; in Indian District, the Moonlight; in Buena Vista, the Peru, Atlas and very many others; from all of which ore has been worked by the mills at Dun Glen and Unionville, with results equally as satisfactory as those above stated, going to show the fact that there are many mines in Humboldt county to-day producing handsome results, milled by the most ordinary process, and which will continue to improve as facilities for working present themselves.

Within the limits of the county are many as rich silver mines as any in the Territory, perhaps not as large as the famous Gould & Curry, but infinitely richer. It is not altogether quantity, but quality, that makes the mine. The ledges there are not half horse and half mineral, but all mineral, paying from one hundred to one thousand dollars per ton.

Other Minerals.—Besides silver, there are immense mountains of copper, and veins of copper, some in a pure state; extensive veins, of such purity as to whittle with a knife; beds of salt, covering thousands of acres; large fields of sulphur, almost in a pure state, which when heated melts and drops in a state of purity; beds of saltpetre and veins of alum, in large quantities. Mountains of limestone and coal of superior quality have recently been discovered also large quantities of chalk, and in fact everything of value in the mineral kingdom.

CHEAP ICE.—It is reported that an important discovery has been made in the manufacturing of ice, by a citizen of London, England, for which a patent is about to issue. The inventor claims that by the use of his process, ice can be manufactured cheaper than it can ordinarily be cut and stored. Possibly the English inventor has hit upon something similar to the process employed in Bengal, and elsewhere noticed in our present issue.

THE ROMAN STREETS.—The great Roman roads have left their impress on soil and language. In many places we may trace their route, even though the plow or the spade has obliterated physical signs, by the aid of local names. The Saxons were not road makers. Vast works, undertaken with a comprehensive imperial purpose, were beyond the range of Saxon civilization. The Saxon "streets" were borrowed from the Roman "strata," or paved roads; and the word street enables us to recognize the lines of Roman road which, straight as an arrow, connect the chief strategic positions in the island. Ardwick Le Street, in Yorkshire; Chester Le Street, in Durham; such places as Stretton, Stratton, Stretford, Stratford, Streatham, Streatley, tell of their position on the line of the Roman road. Roman roads which do not bear the name of street are often called port-ways. There are nine portways in different parts of the kingdom. In the Scandinavian districts the word "street" becomes "gate." In York, Leeds, and other towns the older streets are gates. In Manchester, too, we have Millgate, long, short, and old; St. Mary's gate; and the same word is found as far north as Edinburgh, in the Cowgate and Canongate. The terminations or prefixes, "bridge" and "ford," are too significant to need comment. These illustrations might be multiplied indefinitely, for the whole country teems with names which tell their own tales, and furnish valuable materials to the historian.—*English Paper.*

GENERAL MCDOWELL TAKES A RIDE.—The teamsters who drove General McDowell and staff to Fort Churchill gave them a specimen of driving which must have astonished them not a little. The driving was of the same style as that with which Hank Monk astonished old Horace Greeley. Relays of horses were provided along the road, and the boys put the General through at railroad speed. They went down Six-Mile Canon on the dead run. At the Gould & Curry Mill everybody supposed the team running away, and looked on in consternation. When they reached the station on the Carson known as the Frenchman's, the axles of the carriage were nearly red hot. It was found necessary to take off the wheels and pour water on the spindles. The General has doubtless been through battles without being half so much frightened as during this ride. Yet he stood it without crying for quarter.—*Enterprise.*

A CURIOSITY.—While a carpenter was sawing a beam, in this city, a few days since, says the Stockton *Independent*, he cut a knot asunder which contained a perfect miniature picture of a dog's head. The curiosity was noticed by W. W. Lee, who obtained one of the pieces containing the picture; and afterward the other part was secured by Mr. Weihe. Canine eye, face and ears, in dark color, were as accurately represented as it is possible for an artist to do with a brush.

OUR Eastern fishermen are reaping a good harvest this season. A correspondent writing from Lubec says that herring are plenty and fatter than for a number of years. It usually takes four hogsheads of fish to make one barrel of oil. This season it requires but a little over one hogshead. The oil, which three years ago sold for $9 per barrel, now sells readily for $40, and herring that last year commanded 25 cents per box now sell for 70 cents.

IT is stated to be a rule of law in the far western territories that "a town is a place where whisky is sold." By means of this rule the courts distinguish real towns from those which exist only on paper plans of land speculators.

THE whole number of National Banks to this time is five hundred and eight, with a total capital of eighty-three millions three hundred and sixty-four thousand dollars.

IT will take till 1868 to finish the tunnel under Lake Michigan at Chicago, to supply that city with water. The tunnel is to extend two miles under the lake.

DIVORCES.—One hundred applications for divorces have been made to Judge Ferris, of Virginia City. Of these, eighty-seven were commenced by the wives.

IMPORTANT DISCOVERY
— IN THE —
Photographic Art.
Jacob Shew's
CHROMATIC PROCESS OF PRINTING PHOTOGRAPHS.
[PATENT APPLIED FOR.]
THE UNDERSIGNED WOULD ANNOUNCE TO THE public that he has discovered a new and IMPROVED PROCESS for printing Photographs, which produces a
SOFTNESS, CLEARNESS AND DELICACY OF TONE
unattainable by any other known process and to which he has given the above name. It is applicable to any size of Photograph, and those having valuable old negatives which they desire printed by the improved process can do so at any time.
In order to secure the pecuniary advantages to be derived from this important discovery a patent has been applied for. When obtained, the privileges of the right will be disposed of at a reasonable rate to any Photographer desiring it. In the meantime all are warned against encroachments upon the rights of the discoverer as such will be prosecuted to the full extent of the law.
"Cartes de Visite" and large Photographs printed by this process will be furnished at the prices of the ordinary work of other establishments.
☞ The public are invited to examine specimens at my Gallery. ☜ JACOB SHEW.

MINING COMPANIES and others connected with the Mining Interests of California, will find all possible desired information in the *Mining and Scientific Press* of San Francisco, which is an ably edited Journal, smartly handled, and well up to the times. The Mining Companies of California, are awake to the advantages of having their Mining Notices, comprising Assessments, Dividends, Elections, &c., concentrated in the advertising columns of one Journal, as we notice in the issue of the *Press* of May 7th, there are no less than seven pages of this interesting matter.—*U. S. Mining Journal, Railroad and Financial Advertiser, New York.*

THE PACIFIC IRON WORKS,
First & Fremont Sts., between Mission & Howard, San Francisco.
The proprietors of the above works, invite the attention of all parties interested, to their greatly improved and unequaled facilities for manufacturing Steam Engines and Boilers, both Marine and Stationary, of any required size and pattern, Quartz Mills, Amalgamating, Pumping and Hoisting machinery of the most approved construction, Flour, Saw and Sugar Mills, Water Wheels, &c., &c. Our pattern list is most complete and extensive, embracing the late improvements in all classes of machinery adapted to use on this coast. We would call especial attention to the fact that we have secured the exclusive right of manufacture for the Pacific Coast of the celebrated Greene Engine, conceded to be the most economical and perfect working Engine now in use. We are also exclusive manufacturers of the celebrated
Bryan Ballery, Varney's Amalgamators and Separators, Ryerson's Superheated Steam Amalgamators and Rotary Crushers, Stone Breakers, &c., &c. Orders respectfully solicited.
GODDARD & COMPANY.

Machinists and Foundries.

VULCAN IRON WORKS CO.,
[ESTABLISHED 1850.]
No. 137 and 139 First Street.
IRON FOUNDERS, STEAM BOILER MAKERS AND
STEAM ENGINE BUILDERS.
THE Machine Shop possesses the greatest number and the largest dimentions of Tools in the State. They have Lathe to turn nine feet in diameter and thirty feet long. Their other facilities for executing work rapidly and efficiently are unsurpassed. Upwards of 300 STEAM ENGINES, made at their own Works, are now running in this State and Oregon, in Steamboats, Quartz Mills, Saw and Flouring Mills. Their BOILER WORKS have turned out upwards of 600 STEAM BOILERS of all kinds.
MACHINERY
Quartz Mills, Flour Mills, Hydraulic and other Presses, Hoisting Machines, Gearing Pullies, Gudgeons, Boxes, Hangers, etc., in Great Variety.
Quartz Stampers, Shoes & Dies,
Warranted to be made of the very hardest and toughest Iron.

Assaying by the Humid Process.

The Territorial *Enterprise* of the 9th inst., contained the following item :—

At the assaying office of Theall & Co., we a day or two since examined an apparatus for assaying by a humid process which appears to have many advantages over the common plan of assaying by fire. The great advantage of the humid way, however, is its superior correctness in assaying ores or bars of silver. Gold may be kept in a molten state for a great length of time without suffering any perceptible loss, but this is not the case with silver. It is a very volatile metal, and it is only by the closest attention and the greatest care during the progress of a fire assay that loss can be prevented by sublimation or absorption by the cupel. In the humid process only acids and a solution of common salt are used. The method by which assays are made and the value of ores and metals ascertained, we have not space to explain. This plan of assaying is bound to supercede the old method, especially in this region, where nearly the whole work in the assay offices is in silver.

The item brought out the following communication in the next day's issue :—

EDITORS ENTERPRISE :—In regard to an article—"*Assaying by the Humid Process*"—in your yesterday's issue, allow me to make a few remarks on the subject to correct a few erroneous allegations therein.

Silver is not a *very* volatile metal. Next to gold, it is one of those precious metals which are the least apt to votalize, unless unskillful hands or careless manipulators expose it too long to a strong heat and draft, when the stream of air carries off a very small portion of the silver, like hydrogen and carbon set free from acids, etc., takes the sulphur along from its combining elements as a companion.

With another remark, in conclusion of the said article, I cannot reconcile either the theory or the experience of our eminent chemists and assayers.

Since 1829, when Gay-Lussac proposed to the French Government the adoption of the Humid process for assaying silver, it was only applicable to silver alloyed in a *molten* state, and although it cannot be denied that this process has undergone, since then, great improvements, there are still difficulties in the way of its general adoption in all localities, as, for in stance, in Washoe.

Supposing the silver contains only a small quantity of mercury or lead, then it requires not only the skill of an assayer, but also the scientific operations of an experienced chemist, to avoid the precipitation by salt water of the base metal chlorides along with the chloride of silver from its solution in nitric acid. Neither is this simple method of assaying applicable to *ore assays* until the metals have passed through the muffle furnace in the usual way of fire assay.

But scientific operators may assay either, in the humid or dry way, working with many other chemicals than salt and nitric acid ; as it is indispensably necessary to judge about the nature and composition of the ore (particularly in this Territory) before making an assay, so as to select the proper ingredients, fluxes and materials, for the purpose of getting at the correct result. LEOPOLD KUH.

The Expansion of Steel.

It is a well known fact, among those who are in the habit of hardening, that the hardening of steel increases its dimensions But there may be some who have had very little to do with it who may yet be ignorant of it, therefore it may be useful to acquaint those with it. But the amount of this expansion cannot be exactly stated, as it varies in different kinds of steel, and even in the same steel operated upon at different heats. But this expansion can be prevented in a great measure by annealing the steel about three times before the article is completely finished. For instance, when the first skin is taken from the steel it should be annealed again, and then another cut taken from it and annealed again, and so on for the third time ; and I have found that articles treated this way will always keep their size better in hardening than if the steel was only annealed once. But this may appear to some to be a deal of trouble, but they will find there is a saving in the end, as hardened steel is very difficult to work, and the working of hardened steel is very difficult, unknown to a great number of people ; and many that know how to work on it have not things convenient for it, such as buffs, laps, or stones. Therefore, to keep the article as near the proper size as possible is a matter of importance. I have had articles that have only been annealed once that have taken many hours to lap to the proper size after hardening ; and I have had articles of the kind, and from the same steel, and hardened at the same heat, that have been annealed three times, that have scarcely required to be touched after they have been hardened.—*G. Ede.*

Machinery.

WHEELER'S
Amalgamating & Separating Pans.

IT IS ACKNOWLEDGED BY ALL WHO HAVE EXAMINED the principles and witnessed the operation of these Pans, that they are decidedly superior for triturating and amalgamating purposes to any other in use.

The most important principle connected with the operation of these Pans is the separation of the triturating process from that of extracting the amalgam from the sand. The chief cause of loss of the precious metal arises from the passing off of the same in combination with the quicksilver, during the process of trituration, and in cleaning up. By the introduction of the Separating Pan to follow the triturating, this loss is entirely avoided. In working these machines there is no appreciable loss of quicksilver, and hence none of the precious metals.

Where these Pans have been introduced and operated by the side of others on sands from the same vat, the superior Pans have uniformly gained a large percentage of metals, over its competitors, as well as a still larger percetage in the amount of work performed.

*** These Pans may be seen in daily operation at the Miners' Foundry, on First street, San Francisco, where all interested are invited to call and examine for themselves.

no16-tf ZENAS WHEELER.

Hepburn & Peterson's
AMALGAMATOR.

THE SUBSCRIBERS WOULD CALL THE ATTENTION of the Mining public to their Reducer and Amalgamator, and also to their Separator for reducing and separating the mineral from

Gold and Silver Ores,

Manufactured and exhibited at the Vulcan Iron Works, Nos. 137 and 139 First street, San Francisco.

These machines secure to the Miner a more Expeditious and Perfect Reduction and Amalgamation, a less liability to accident and delay, and a greater amount of metal saved in proportion to the power employed to keep them in operation than any other machine now in use for producing similar results. This fact is attested to by their general adoption and preference at all the principal Reduction Works in Nevada Territory ; among which may be mentioned the Gould & Curry Mill, the Silver State Reduction Works, Zephyr Flat Mill, Pioneer Mill, Eastern Slope Mill, Phœnix Mill, etc.

☞ This Amalgamator may be seen in operation at Kasteller's Iron Works, Bryant St. between 3d and 4th.

To Quartz Miners.

ALL PERSONS INTERESTED IN MINING MACHINery are invited to call at the Pacific Foundry and examine my Improved Amalgamator. It is unquestionably superior to anything now known for amalgamating Silver and Gold. It works 1000 pounds at a time, and will amalgamate over three tons a day. By the motion of the revolving muller, the pulp is drawn through its center and passes under it, between the grinding surfaces, to the circumference; from whence it passes again over the muller to the center, through the holes and between the grinding surface to the circumference as before. Thus a constant circulation of the pulp is kept up, bringing the particles of ore again and again under the muller, until reducing the whole mass to an impalpable powder.

No quicksilver lies between the surfaces to be ground, but at the circumference and center of the pan where the metal must pass through it as the pulp circulates.

A patent was granted for this Amalgamator in December last, and all persons are again warned aginst purchasing machines made at the Miners' Foundry, called "Wheeler's Amalgamator," as they are an infringement on my patent, and a suit is now pending in the U. S. present Court against the parties infringing. My Amalgamator can be seen running at the Pacific Foundry, where all can judge of their operation and the very superior style in which they are being manufactured. THOMAS VARNEY.

PRATER'S
PATENT CONCENTRATOR.

THE PROPRIETORS OF THIS NEW CONCENTRATOR, having completed arrangements for its manufacture at the Fulton Foundry, in this city, now offer it to the public, with the fullest confidence that for the purpose for which it is designed

It Has No Equal in Use.

The principle of this machine, which is designed for a Concentrator exclusively, is entirely new. It is designed for separating finely divided quicksilver, amalgam and gold from the sands, and for concentrating and saving the sulphurets, and is to be placed behind all or any other machine in use.

This machine is now running on waste sands, from which it is taking out an average of 3½ pounds of quicksilver for each ton of sand. Orders or letters of enquiry may be addressed to

HUNGERFORD & PRATER, Proprietors.
San Francisco, April 1st. 1864. 14v8-tf

Disney's Cylinder Amalgamator.
The Cheapest and Best.

DISNEY'S CYLINDER AMALGAMATOR, WHICH HAS recently been introduced to the public, has already been proved a complete success, and can be furnished, at a price cheaper than any other in use. It is simple in construction, and so arranged as to do a large amount of work with the smallest expenditure of power. The proprietor is satisfied that he can do more work in a given time and with a given expenditure of power than any other amalgamator in use. For small companies who desire cheap yet effective machines, none can be more desirable.

It may be seen in operation at the Rail Road Foundry on Fremont street where

A NEW CRUSHER

Is in operation and he can crush and Amalgamate at the LOWEST RATES. Miners and all others interested are invited to call and examine for themselves.

M. DISNEY, Patentee.
San Francisco, June 23, 1864. 1-3m

IMPROVED WATER-WHEEL,
—PATENTED BY—
JOHN TYLER, WEST LEBANON, N. H.

Giving the Maximum Power with the Minimum Cost; Having the Following as Some of Its Advantages Over Others—Giving the Best Percentage of Water Used, Durability,

It runs Equally as well IN Back Water as OUT.

IT IS ADAPTED TO HIGH HEADS OR LOW—IT IS NOT liable to get out of repair—It can be put to running by any Machinist in a very short time—It is the steadest running and easiest regulated wheel in use—There are now some 500 of them in use in the United States and Canadas, running under all heads, from 4 to 80 feet, and giving universal satisfaction. Address

SMITH & HANSCOM,
15v8-3m Golden State Iron Works, San Francisco.

DUNBAR'S
PATENT SELF-ADJUSTING
Piston-Packing.

Requires no Springs or Screws; Is always Steam Tight, without excessive friction, and never gets slack or leaky.

IT WILL SAVE EACH SEASON MANY TIMES ITS COST in friction, time, steam and power. No engine, old or new, should be without it. It can be easily fitted to old or new Pistons.

Having obtained the Agency of this VALUABLE IMPROVEMENT, I am prepared to furnish it wherever desired. For further information, address HENRY S. SMITH,

23v8 Golden State Iron Works, San Francisco.

HUNT'S
IMPROVED WIND-MILL.

THIS WIND-MILL IS RAPIDLY taking the place of all other Mills on the Pacific Coast. These Mills are so simple in their construction, that when once built, they can be put in order by almost any person, and when once in order they will run for years without repairs.

Prices, from $50 to $1,000.

ROUND AND SQUARE WATER TANKS BUILT TO ORDER.

HUNT'S PUMPS

Are admitted to be the best in the Market for Wind Mills, being built expressly for that purpose. They can be set, and taken apart with a common wrench, and are very easily repaired.

HUNT'S ENDLESS CHAIN
HORSE POWER
For Sawing Wood.

ALSO, THE

Self-Regulating Horse Power

Is so arranged as to give a steady motion, and is calculated to be used for turning Wood, Iron or Brass, also for Scroll or Circular Sawing, and is fully equal to Steam for any light work. The above Machines are built of the best materials, and made as Durable as Wood and Iron will make them.

ALL WORK WARRANTED.

☞ For further Particulars see small circulars. ☜

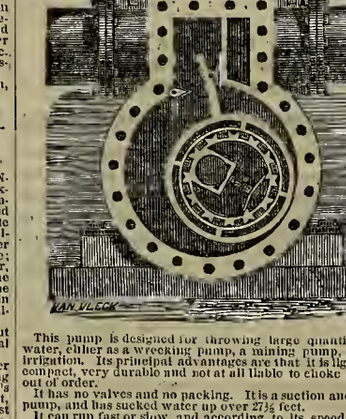
No. 28 Second Street, and 108 & 112 Jessie Street, San Francisco. 26-3m

HARRISON'S ECCENTRIC PUMP.



This pump is designed for throwing large quantities of water, either as a wrecking pump, a mining pump, or for irrigation. Its principal advantages are that it is light and compact, very durable and not at all liable to choke or get out of order.

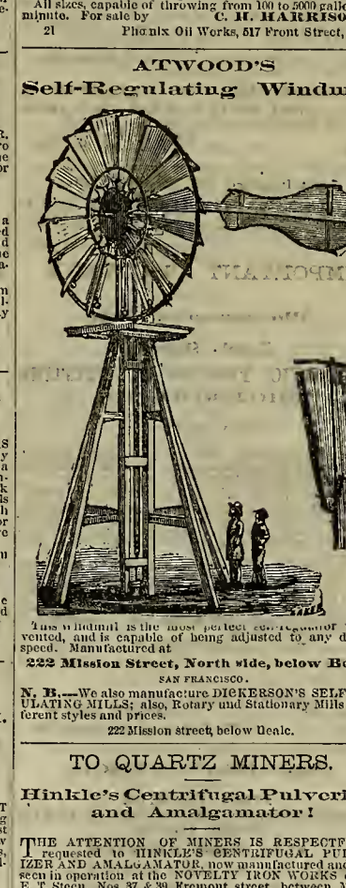
It has no valves and no packing. It is a suction and force pump, and has sucked water up over 27½ feet.

It can run fast or slow, and according to its speed is the quantity of water discharged.

All sizes, capable of throwing from 100 to 5000 gallons per minute. For sale by C. H. HARRISON,

21 Phœnix Oil Works, 517 Front Street, S. F.

ATWOOD'S
Self-Regulating Windmill.



This windmill is the most perfect self-regulator yet invented, and is capable of being adjusted to any desired speed. Manufactured at

222 Mission Street, North side, below Beale,
SAN FRANCISCO.

N. B.—We also manufacture DICKERSON'S SELF-REGULATING MILLS; also, Rotary and Stationary Mills of different styles and prices.

222 Mission street, below Beale. 15

TO QUARTZ MINERS.
Hinkle's Centrifugal Pulverizer and Amalgamator!

THE ATTENTION OF MINERS IS RESPECTFULLY requested to HINKLE'S CENTRIFUGAL PULVERIZER AND AMALGAMATOR, now manufactured and to be seen in operation at the NOVELTY IRON WORKS of Mr. E. T. Steen, Nos. 37 & 39 Fremont street, between Market and Mission streets.

This machine is the best in the State for the purpose of Pulverizing and Amalgamating ORES. The whole machine, made entirely of Iron, will not exceed One Ton, and no piece of it will exceed 200 pounds, which makes it very convenient for transportation to remote districts. It will work Two Tons of Rock per day.

Mr. Hanson, who is running one of the machines, is an experienced Amalgamator, and will receive Ores at the above named places, and extract the metals and furnish assays for all persons wishing the same. The Subscriber is also perfecting a HAND MACHINE for Miners engaged in prospecting, which will work 25 pounds of ROCK at a time, and which will weigh about 125 pounds.

The Pulverizer and Amalgamator works Rock of the size of a grain of corn to an impalpable powder. Apply to

SALMON'S
PROPELLER AMALGAMATOR.

The proprietors and inventors of this machine, after fourteen years of practical experience in mining in California and Nevada Territory, and having a thorough knowledge of the wants of Miners and Mill men, have succeeded in making an Amalgamator, which, for the purposes intended, far surpasses any other yet presented to the public, and which can be furnished at less than one-half of the expense of any other Amalgamator, now in use, besides requiring less labor to clean and keep in running order. The Amalgamator is simple in its construction, consisting of a pan or tub constructed of wood and adapted to either a Stone or Iron bottom. Opposite each other, and on the inside of the tub, are two flanges, from two to four inches broad, reaching from the top to near the bottom, with room for the mullers to pass under. These flanges are for the purpose of preventing the pulp from forming a circular current, and together with a number of wings placed like a screw propeller on the muller-shaft, force a current continually on the quicksilver at the bottom and under the grinding surface of the mullers. This peculiarity of propeller-screw and side wings, in combination with a deep tub, are what the proprietors claim as new and for which a patent has been applied for. The Inventors of this machine are practical Mechanics as well as experienced miners, and the machine offered by them to the public is the result of long experience and close observation. Manufactured at the San Francisco Foundry, San Francisco, Cal. by

Worth Considering.—Advertising has proved the medium of success to many of the most prominent business men of the world. Merchants, Inventors, Builders, Patentees, Manufacturers, Foundrymen, Machinists, and, in fact, all who wish to call the particular attention of the Mining, Professional, Mechanical and Industrial members of the community to their business, should not fail to advertise in the MINING AND SCIENTIFIC PRESS. The circulation of the paper is extensive, and has a wide range, reaching the most intelligent readers in every mining settlement of importance on the coast. A large number of copies are also sent East. Our terms are reasonable. "Live and help live" we believe to be a sensible motto.

ENLARGED.—The *Mining and Scientific Press*, of San Francisco, commenced its ninth volume to-day in an enlarged form. This valuable journal has been deservedly successful, and should have a large circulation among the mining community.—*Alpine Chronicle.*

POSSIBLY A BIG SWINDLE.—The San Francisco correspondent of the Gold Hill (N. T.) *News* says: The press of this city has passed gingerly over the arrest of Franks, on the charge of forging the name of the President of the Utah Mining Company, of Aurora, on drafts of large amounts, and generally 'bonnigswoggling' the company out of, as is roughly estimated, say $20,000 at least. I do not know whether the charges are true or not, but from letters exhibited to me, and charged to have been written by him to the superintendent of the mine, I am prepared to see an exposure, when the case comes into court, which will make both the stockholders in San Francisco and also in the mountains open their eyes and commence investigating the conduct and management of other companies more closely than heretofore. If $17,000 can be wrung out of one company in a single month, when but $2,000 worth of work was done, powder and other supplies can be systematically disposed of at the rate of hundreds of dollars per month, claims can be "salted," and other claims which are really yielding richly, made to turn out nothing by the proceeds of the working being credited to another mine, as alleged in this case, who can tell how many other companies are similarly managed, and how far the general 'hardupness' of the community is attributable to swindling out and out, rather than to honest but misdirected expenditure of capital by superintendents and officers of a corporation.

CITY RAILWAY FARES.—The Buffalo city railway companies having applied to the Common Council for permission to increase their rates of fare, the case was laid before Judge Morton, who decided that the Common Council has not the power to alter the terms of the original contract, in accordance with which the franchise was granted. Even if the city should consent to an increase of fare, any passenger would have the right to demand transportation at the price originally fixed. A railroad grant is a contract to do a certain work, for a certain price, and the original rate of fare is the price fixed by that contract.

Mining and Scientific Press Patent Agency.

SAN FRANCISCO.

Information About Obtaining Patents.

The Patent Law Amendment Act, of March 4th, 1861, and March 3d, 1863, now in force, introduces several important changes in our Patent System. The general practice of the Patent Office, however, in regard to the examination and issue of Letters Patent for new inventions, remains nearly the same as heretofore.

The amendment of 3d March, 1863, provides, in section 3, that every patent shall be dated as of a day not later than six months after the time at which it was passed and allowed, and notice thereof sent to the applicant or his agent. And if the final fee for such patent be not paid within the said six months, the patent shall be withheld, and the invention therein described shall become public property as against the applicant therefor: *Provided*, That in all cases where patents have been allowed previous to the passage of this act, the said six months shall be reckoned from the date of such passage.

The first question, therefore, that presents itself to the inventor, who desires to procure a patent, is: "Can I obtain a patent?" A positive answer to this question is only to be had by presenting a formal application for a patent to the Government, embracing a petition, specification, model, duplicate, drawings, and the payment of the prescribed official fees. Aside from these steps, all the inventor can do is, to submit his pinas to persons experienced in the business of obtaining patents, and solicit their opinion and advice. If the parties consulted are honorable men, the inventor may safely confide his ideas to them, and they will inform him whether or not his invention is probably patentable.

Those who have made inventions and desire to consult with us respecting the same, are cordially invited to do so. We shall be happy to see them in person at our office, or to advise them by mail, or through the MINING AND SCIENTIFIC PRESS. In all cases they may expect from us an honest opinion. For these consultations, opinion and advice, we make no charge. A pencil-and-ink sketch, and description of the invention should be sent, together with a stamp for return postage. Write plain; do not use pencil or pale ink; be brief.

Remember that all business committed to our care, and all consultations, are kept by us secret, and strictly confidential.

Preliminary Examinations.

In some cases it may be advisable as a measure of prudence to order a preliminary examination. This consists of a thorough search made at the U. S. Patent Office, Washington, through the medium of our associate in that city, to ascertain whether among all the patents and models there stored, any invention can be found which is similar in character to that of the applicant. On the completion of this special search we send a written report to the party concerned, with suitable advice. Our charge for this service, including the report, is ten dollars. This search, though it involves the expense just named, will usually prove satisfactory, if the same device has been before patented, the time and expense of constructing models, preparing documents, etc., will in most cases be saved; if the invention has been in part patented, the applicant will be enabled to modify his claims and expectations accordingly. Many other obvious advantages attending the Preliminary Examination; although the strictest search does not always enable the applicant to know positively whether a patent can be had. Applications for patents are often rejected because the Examiner officer finds a description of the alleged invention in some foreign publication; or some other person has been previously rejected on an analogous device; or some other invention for a similar purpose, but partially resembles the applicant's in its construction; or the Government makes an unjust or uncommon decision. Against none of these contingencies does the Preliminary Examination provide; it will, however, generally inform the applicant whether an improvement similar to his and used for the same purpose has ever been patented or not in this country.

Persons desiring the Preliminary examination are requested to remit the fee ($10), and furnish us with a sketch and description of the invention.

Caveats.

A Gavent is a confidential communication made to the Patent Office, and is therefore filed within its secret archives. The privilege secured under a caveat is, that it entitles the caveator to receive notice, for a period of one year, of any application for a patent subsequently filed, and which is adjudged to be novel, and is likely to interfere with the invention described in the caveat, and the caveator is then required to complete his application for a patent within three months from the date of said notice. Caveat papers should be very carefully prepared. Our fee for the service varies from $10 to $20. The Government fee under the new law is reduced to ten dollars; and this sum does not apply, as heretofore, as part of the fee on presenting an application for a patent.

Inventors will oftimes find it very important to take advantage of the caveat system—the expense under the law being comparatively small.

To enable us to prepare caveat paper, we only require a sketch and description of the invention; no model being necessary.

Expense of Applying for a Patent, Rejections, etc.

Under the new law, the Government fee, on filing an application for a patent, is fifteen dollars; and if the patent is allowed, twenty dollars additional is required. If rejected, the first fee of fifteen dollars is all that is demanded. English, French, Austrian, Prussian sp[illegible], and inventors of every nationality, may [illegible] patents in the United States upon the same terms as our own citizens. The only discrimination made is against subjects of government that discriminate against the inhabitants of the United States.

To the foregoing official fees must be added the Attorney's fees for preparing the various documents and drawings. Our charge for preparing a case, presenting it to the Government, and attending to all business connected with it, until a decision is given, is from $30 to $40. If the patent is granted no further agency expenses a case. If the application is rejected we cause a thorough investigation to be made into the reasons presented to the Commissioner for refusing the patent. In making this examination, we have access to all the drawings, models, books and specifications cited in reference, and we report the result as early as possible to our client. For this service we make no charge. If the rejection proves to be an unjust one—which sometimes happens—it can generally be reversed, and the patent obtained by reinstating the case. For this prosecution we charge a fee proportionate to the extra labor involved, payable only on the issue of the patent; but our demand will be reasonable and satisfactory to our clients, and will be arranged beforehand by special agreement.

The system adopted by us works well, gives general satisfaction and presents to all applicants, rich or poor, an equal opportunity of having their patent cases prepared, conducted and presented in the best manner, by experienced attorney's, upon the most moderate terms. Inventors who have rejected cases, prepared either by themselves, or for them by other agencies, and desire to negotiate in the prospects of success by further efforts, are invited to avail themselves of our unequalled facilities in securing favorable results. We have been successful in securing Letters Patent in many cases of such a matter. Our terms for such cases are very moderate.

Models, Remittances, etc.

The law requires that the inventor shall, in all cases, furnish a model, which must not exceed twelve inches in any of its dimensions; it should be neatly made, of hard wood or metal, or both, varnished or painted; the name of the inventor should be engraved or painted on it conspicuously.

When the invention consists of an improvement on some known machine, a full working model of the whole will not be necessary. It should be sufficiently perfect, however, to show, with clearness, the nature and operation of the invention.

As soon as the model is ready, it should be carefully boxed and shipped by express or otherwise, to our address, namely: DEWEY & Co., Mining and Scientific Press, rooms 56 and 57, Government House, corner of Sansome and Washington Streets, San Francisco, Cal. Prepay expenses and send express receipt to us by mail.

Simultaneously with the model, the inventor should send us the first installment of the Government fee, fifteen dollars. The money may be forwarded either by express with the model, or by mail. The safest way to remit is by draft on San Francisco, payable to our order. Always send a letter with the model, and also the remittance stating the name and address of the sender.

A full description should also be sent with the model, embodying all the ideas of the inventor respecting the improvement.

On the receipt of the model and Government fee, the case is duly registered in our books, and the application proceeded with as fast as possible. When the documents are ready we send them to the inventor by mail, for his examination, signature and affidavit, with a letter of instruction, etc. Our fee for preparing the case is then due and will be called for. The case will then be presented to the Patent Office, and as soon as the patent is ordered to be issued the Government fee, namely, twenty dollars.

Inventors who do business with us will be notified of the state of their application in the Patent Office, when it is possible for us to do so. We do not require the personal attendance of the inventor, unless it is one of great complication the business can be well done by correspondence.

When the invention consists of a new article of manufacture, or a new combination, samples of the separate ingredients, sufficient to make the experiment, and also of the manufactured article itself must be furnished.

The average time required to procure a patent, when the case is conducted at our agency, is about three months. We frequently get them through in less time; but other cases, owing to delay on the part of officials, the period is sometimes extended to four or five months, and even more. We make a special point to forward our cases as rapidly as possible.

Return of Models.

Under the new law, if the applicant's case has been rejected he is entitled to withdraw his model from the Patent Office.

This law applies to all past rejected cases, and if parties wish to obtain their models through us, they can do so at a small expense.

Application for Patents, Designs, Trade-Marks, Labels, etc.

Under the new law patents may be taken out for any new form of any article, also for tools, patterns, castings, machine-frames, stove-plates, borders, fringes, all new designs for printing, weaving or stamping upon silks, carpets, carpets, oil-cloth, prints, paper-hangings, and other articles. Trade-marks, labels, envelopes, boxes and bottles for goods, may also be patented; likewise all works of art, including prints, paintings, busts, statues, bas-relief, or compositions in alto, or bas-relief, new ideas, designs or compositions to be placed upon any article of manufacture, architectural work, etc.

Our facilities for the prompt preparation and securing of patents are of the most thorough character and our charges are very moderate.

Patent Office Fees, and How Payable.

Nearly all the fees payable to the Patent Office are positively required by law to be paid in advance. For the sake of uniformity and convenience, the remaining fees will be required to be paid in the same manner; that is to say, before the labor is performed for which they are to be received in payment.

The following is the tariff of fees established by law:

On every application for a design, for 3 y'rs and 6 mos...	$10
On every application for a design, for seven years.....	15
On every application for a design, for fourteen years..	30
On every caveat.....	10
On every application for a patent.....	15
On issuing each original patent.....	20
On filing a disclaimer.....	10
On every application for a re-issue.....	30
On every additional patent granted on a re-issue.....	30
On every application for an extension.....	50
On the grant of every extension.....	50
On appeal to the Commissioner from Examiners-in-chief	20
On every appeal to the Judges of Circuit Court, D. C....	25

Infringements.

The manufacture, sale, or use of a patented article, without the consent of the owner of the patent, is an infringement, and subjects the infringer, by injunction from the Court, to an arrest of or prohibition from the employment of his machinery, shop, works, factory and men in production of the article.

In addition to injunction the infringer is liable to be mulcted in treble the amount of damage awarded by the jury. The maker, the workman, the seller, and the purchaser, if a user, are all liable either collectively or individually.

Having access to all the patents, models, public records, drawings and other documents pertaining to the Patent Office, we are prepared to make examinations and give opinions upon all infringement questions, advise as to the scope and ground covered by patents, and direct with vigor any legal proceedings therewith connected. Our charge will be moderate, and proportionate to the labor involved.

Appeals.

In rejected and other cases, the new law provides for an appeal from the Examiner-in-chief to the Commissioner in person, on the payment of a fee of twenty dollars. A further appeal may be taken from the decision of the Commissioner to the U. S. Court, of the District of Columbia. These appeals are heard by any one of the Judges before whom the applicant elects to bring the case. No Jury. All the papers, models, etc., are sent by the Commissioner to the Judge, who then reviews the case, and either sustains or reverses the Commissioner's decision.

The party taking the appeal pays an additional fee of twenty-five dollars. The Judge appoints a day of hearing. The applicant appears in person or by counsel and states his case and file a written argument. Five days are allowed the opponent to put in an answer, and a similar period to the appellant for a closing reply.

Many important cases are brought before the Judges on appeal and the decisions of the Commissioner are not unfrequently reversed.

We have had successful experience in conducting these appeals and our services are rendered on moderate terms.

DEWEY & CO., Agents,

Mining and Scientific Press Office, Government House, corner Sansome and Washington streets, San Francisco.

REVERSED.—The course of the rag trade on this coast appears to be reversed. A few years ago rags were gathered in our streets by tons and shipped to China, there to be made into paper by the Celestials, but owing to the increase and increasing demand for paper, and for materials from which to manufacture the same, in this country, the course of trade in this commodity has been reversed. Recently the barque Delaware, with an entire cargo of rags, arrived from Shanghai. The rags are assorted and prepared for the mills by Chinamen.

FIRE IN AUBURN.—For the fourth time in the history of Auburn, that place has been desolated by fire, originating in the Chinese quarter of the town. The last one occurred on Friday, and destroyed thirty-five houses and some $35,000 worth of property. The Placer *Herald* suggests, as a preventive of similar occurrences in future, that they should build of earth and gravel, a suitable material of that kind being abundant there, costing but a trifle more than wood, and looking neat and substantial.

AMERICAN WOMEN AND THE WAR.—The women of Carthage, when the Romans were at the gate, gave their hair to be made into bowstrings; the Countess Isabella vowed never to change her chemise until the beseigers had been driven from her castle walls; and the butchers' wives of Newgate Market declared they would drink no more burnt sack until King Charles' head was cut off; but I question whether ancient or modern history can furnish an example of a conflict which was so much of a "woman's war" as this. The bitterest, most vengeful of politicians, in this ensanguined controversy are the ladies. They differ in opinion, but in exasperation and implacability they are unanimous.

DISCONTINUED.—Quite a number of weekly papers have been stopped, recently, in the Eastern States, in consequence of the high price of paper and labor.

BRANDRETH'S PILLS.—The weak, the consumptive, rheumatic, costive, bilious and delicate, after some day's use, will find renewed strength and life pervade every organ of their frames. Sold by all Druggists.

New Mining Notices.

Arizona Consolidated Mining Company, Eureka District, Arizona Territory.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 19th day of October, 1864, an assessment of 20 cents per share was levied upon the Capital Stock of said Company, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, No. 728 Montgomery Street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on Saturday, the 19th day of November, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 3d day of December, 1864, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

N. O. FRENCH, Secretary.

Office, 728 Montgomery street, San Francisco. 17-4

Napa Gold and Silver Mining Company, Silver Mountain District, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 17th day of October, 1864, an Assessment of thirty (30) cents per share was levied upon the Capital Stock of said Company, payable on the 19th day of October, 1864, in United States gold and silver coin to the Secretary, or to S. A. HAWKINS, Superintendent, Silver Mountain.

Any stock upon which said Assessment shall remain unpaid on Saturday, the 19th day of November, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 3d day of December, 1864, to pay the delinquent Assessment, together with the costs of advertising and expenses of the sale. By order of the Board of Trustees.

J. WARREN CLARK, Secretary.

Office, 420 Montgomery street, San Francisco. Sale at the office of the company, at 1 o'clock P. M. 17-4

Steamboat Silver Mining Company, Star District, Humboldt County, N. T.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 17th day of October, 1864, on assessment of one dollar per share was levied upon the Capital Stock of said company, payable on the 18th day of October, 1864, in United States gold coin, to the Secretary, or to JAS. S. MACLEAN, Superintendent at the mine.

Any stock upon which said assessment shall remain unpaid on Saturday, the 19th day of November, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Monday, the 5th day of December, 1864, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

S. O. PUTNAM, Secretary.

Office, Northeast corner Jackson and Front streets, San Francisco. 17-4

Postponements and Alterations.—Secretaries are requested to give notice of postponements, or alteration, which they may desire made in their advertisements, at their earliest convenience. New advertisements should be sent in as early as possible.

DEWEY & CO., Publishers.

Office, 57 Government House, corner Washington and Sansome streets, San Francisco.

Ontario Mining Company, Little Miami Ledge, Reese River Mining District, Lander county, N. T.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 17th day of October, 1864, an assessment of twenty five cents per share was levied upon the capital stock of said company, payable immediately, in United States Gold and Silver Coin, to the Secretary, or to Jos. S. CRANE, in Austin, N. T.

Any stock upon which said Assessment shall remain unpaid on Saturday, the 19th day of November, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 3d day of December, 1864, to pay the delinquent Assessment, together with the costs of Advertising and expenses of the sale. By order of the Board of Trustees.

C. H. BURTON, Secretary.

Office, Room No. 4, N. W. corner Clay and Front streets, San Francisco, Cal. 17-4t

La Libertad Gold and Silver Mining Company, Cuacuchilas District, Lower California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 26th day of July, 1864, an assessment of one dollar per share was levied upon the capital stock of said Company, payable on the 3d day of September, 1864, in United States Gold and Silver Coin, to the Secretary.

Any stock upon which said assessment shall remain unpaid on Saturday, the 19th day of November, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on the 3d day of December, 1864, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

WILLIAM VALE, Secretary.

Office, No. 36 Exchange Building, N. W. corner of Montgomery and Washington streets, San Francisco. 17-4t

Table Mountain Copper Mining Company, Stanislaus District, Calaveras County, California.

Notice.—There are delinquent upon the following described stock, on account of Assessment levied on the 19th day of September, 1864, the several amounts set opposite the names of the respective Shareholders, as follows:

And in accordance with law, and an order of the Board of Trustees, made on the 16th day of September, 1864, so many shares of each parcel of said Stock as may be necessary, will be sold at the auction room of Jerome Rice & Co., No. 327 Montgomery street, (now Maurice Dore & Co.) San Francisco, on the 5th day of November, 1864, at the hour of 12 o'clock, M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale.

J. M. BUFFINGTON, Secretary.

Office, Nos. 8 & 10 Government House, corner Sansome, and Washington streets, San Francisco. 17

Bound Copies for Sale.—Bound copies of Volume VIII, complete, of the MINING AND SCIENTIFIC PRESS, from January 1st to July 1st, can be procured on application to the office.

ONE HUNDRED DOLLARS IN CURRENCY.—One of our friends, who has been made a speculator by force of circumstances, was yesterday relating to us what a hundred dollars in currency had done for him since the war commenced. In 1861 he exchanged the above amount for one hundred dollars in gold, paying a premium of four dollars and fifty cents for it. The issue of greenbacks which followed soon after, sent up the price of gold to twenty per cent., when he sold his one hundred dollars for that much premium, making a handsome little sum. Finding that the premium on gold kept on increasing, he bought the next day, investing his one hundred dollars with what he had made. In the course of three or four days he sold again, and in a week he sold again, at the end of which time he had doubled his money. He pursued the same course with his two hundred dollars, until gold finally reached 72 per cent., when he sold again, the proceeds amounting to between seven and eight hundred dollars. This he invested in mess pork, at fifteen dollars per barrel, believing there would be, as there was, a re-action in gold; he sold the pork in the course of a month at an advance of seven dollars per barrel; when he made an investment of one-half of his funds in pork, the rest in whisky. But a few days ago, when whisky reached one dollar and eighty cents, and pork fifty dollars per barrel, he sold out, and found that he had sufficient funds to purchase a house on Seventh street, for which he paid seven thousand five hundred dollars. Such we know to be the history of one hundred dollars in currency since the war commenced, and it is in just such a manner that immense fortunes have been made.—*Cincinnati paper*

ARRIVAL OF THE SWEEDISH MINERS.—The Houghton *Mining Gazette* announces the arrival at that place of the first instalment of Sweedish miners, sent out by the Emigrant agency noted in our issue of three weeks since. The *Gazette* says: They numbered two hundred and thirty-eight men, besides the usual accompaniment of women, children, boxes, kettles and pans. The men are as an intelligent, hardy and active lot of men as we have seen, and from their actions are desirous of earning an honest living and commence work at once.

The most serious inconvenience with them is their inability to express themselves in the English language, and were it not for Messrs. Williams of the Smelting Works and a clerk in Butler's store, we don't know how the Agents could have succeeded in getting them separated and away to their respective mines. All, however, was accomplished, and with one exception the crowd broke up into small parties and contentedly trudged away.

HUMAN BONES FOUND.—D. W. Peck, Justice of the Peace, Hope Valley, last week discovered the bones of a man, near a small lake about three miles this side of Mitchell's ranch, and near the trail leading from Hope Valley to Markleeville. They were beside a log, near which a split stick was standing, as if a notice had been attached to it, but none could be discovered. On them were a pair of light, nailed boots, knit under shirt and drawers, a white shirt and a long vest with large pockets. The head was not found, but Dr. Peck discovered some long black hair. The bones were gathered and buried near where they were found by Mr. Coach's men. Last winter, a dog came to Peck's Red Lake House, several times, but would not allow himself to be caught, and every time he went away he started in the direction of the spot where the bones were discovered.—*Alpine Chronicle.*

THE first canal on record was one constructed by Ptolemy Philadelphus, for the purpose of opening a communication between the Nile and the Red Sea. The great canal of China, extending a distance of 825 miles, was commenced in the ninth century. Canals were introduced into England by the Romans, who formed one from the river Nyne, a little below Peterborough, to the river Witham, three miles south of Lincoln; and in 1134, during the reign of Henry I., a canal was made to effect a junction between Trent and Witham. The first canal regularly constructed with locks and sluices was made in 1563, near the city of Exeter.

POSTAGE.—Some people think they are not privileged to carry a sealed letter past a post-office or over a mail route. It is a mistake. Any man has the right to carry a letter anywhere, as an accommodation. He has no right to carry it for pay, however, over a mail route. This regulation is simply to protect the Government against competition. For a letter carried merely as a favor, no stamp is required.

TOO PROUD.—A fourteen hundred dollar clerk was dismissed lately from the Treasury Department, who represented that his pride would not allow him to appear in the United States uniform worn by the clerk's brigade.

Owen's River Canal Company.

CAPITAL STOCK.....$1,000,000

10,000 Shares.....$100 per Share.

A PORTION OF THIS STOCK IS NOW OFFERED TO THE public, and recommended as an investment.

Putnam's Clothes Wringer.

IT IS THE ONLY RELIABLE SELF-ADJUSTING WRINGer. No wood work to swell or split. No thumb screws to get out of order. Warranted with or without cog wheels. It took the FIRST PREMIUM at Fifty-Seven State and County Fairs in 1863, and is WITHOUT AN EXCEPTION the best Wringer ever made. Patented in the United States, England, Canada and Australia. Agents wanted in every town, and in all parts of the world. Energetic agents can make from three to ten dollars per day. Sample Wringer sent Express-paid on receipt of price. No. 2, $6.50. No. 1, $7.50. No. F, $8.50. No. A, $9.50. Manufactured and sold, wholesale and retail, by

THE PUTNAM MANUFACTURING CO.,

No 13 Platt Street, New York, Cleveland, Ohio and Bennington, Vt. S. C. NORTHROP, Agent.

What Everybody Knows,

Viz: That Iron well galvanized WILL NOT RUST; That a simple machine is better than a complicated one; That a Wringer should be self-adjusting, durable and efficient; That Thumb-Screws and Fasteuings cause delay and trouble to regulate and keep in order; That wood soaked in hot water will swell, shrink and split; That wood bearings for the shaft to run in will wear out; That the Putnam Wringer, with or without cog wheels, will not tear the clothes; That cog-wheel regulators are not essential; That the Putnam Wringer has ALL the advantages, and not one of the disadvantages above named; That all who have tested it, pronounce it the best Wringer ever made; That it will wring a Thread or a Bed-Quilt without alteration.

We might fill the paper with testimonials, but insert only a few to convince the skeptical, if such there be; and we say to all, TEST Putnam's Wringer. Test it THOROUGHLY with any and all others, and if not entirely satisfactory, return it.

Putnam Manufacturing Co:—

GENTLEMEN. I know from practical experience that iron well galvanized with zinc will not oxydize or rust one particle. The Putnam Wringer is as near perfect as possible, and I can cheerfully recommend it to be the best in use. Respectfully yours,
JNO. W. WHEELER, Cleveland, Ohio.

Many years experience in the galvanizing business enables me to endorse the above statements in all particulars.
New York, Jan., 1864. JNO. C. LEFFERTS.
No. 100 Beekman St.

We have tested Putnam's Clothes Wringer by practical working, and know that it will do. It is cheap; it is simple; it requires no room, whether at work or at rest; a child can operate it. It does its duty thoroughly; it saves time and it saves wear and tear. We earnestly advise all who have much washing to do, with all intelligent persons who have any, to buy this Wringer. It will pay for itself in a year at most. HON. HORACE GREELEY.
6-tf

READY ROOFING

READY TO NAIL DOWN.

READY ROOFING
At less than half the cost of tin roofs.

READY ROOFING
More durable than Tin.

READY ROOFING
Suitable for steep or flat roofs.

READY ROOFING
For all kinds of buildings, in all climates.

READY ROOFING
Easily, cheaply, and quickly put on. Needs no coating over with cement after it is nailed down.

READY ROOFING
Made of a strong woven fabric, thoroughly saturated and covered upon both surfaces, with a perfectly water-proof composition, and put up in rolls ready for use—40 inch wide, and 75 feet long.

WE ALSO MANUFACTURE
Liquid Cement,
FOR LEAKY TIN ROOFS.

Much cheaper and more durable than oil paint. Also,

Compound Cement,
For Leaky Shingle Roofs,

Which will often save the cost of a new roof.

Samplesses of Ready Roofing and Circulars sent by mail when desired. Favorable terms made with responsible parties who buy to sell again.

READY ROOFING CO.,
6tf 73 Maiden Lane, N. Y.

Important to Secretaries.

Secretaries will please write proper names and figures distinctly, and hand in their advertisements as early in the week as practicable. Our latest forms go to press Friday evening. Any information concerning the requirements of the laws regarding advertisements will be cheerfully given when solicited. Inspect all your notices carefully upon their first appearance. In case of postponement, give the earliest notice possible at the office. When copy is received sufficiently early, a proof-sheet will be furnished if desired. A revised copy rendered, for advertising at the mine, when requested. Neatly printed copies of advertisements, for serving individual notice to stockholders, printed at $1 per hundred. Copies of the new advertising law, as officially published, furnished gratuitously. ☞ Blank forms, for filing out Assessment Notices and Delinquent Sales, supplied free to advertisers in the MINING AND SCIENTIFIC PRESS on application at the office

How to make your Remittances.—In most of the mining towns, bankers will furnish checks on San Francisco at par, (or at a very slight advance,) to those who wish to pay us for subscriptions, advertising, mining blanks, etc When it is more convenient, money may be remitted by mail at our risk if the parties sending will register their letters. Money sent by mail is seldom lost if properly enclosed. An excellent method is that of opening the layers of a card, placing the coins between the layers and sealing the edges together.

Extracts from the Statutes.

The attention of companies who desire advertising their delinquent sales in any other paper than that in which the notice of assessment appears, is called to the following section of the law approved April 4th, 1864:

Section 7. If any portion of the assessment mentioned in said notice shall remain unpaid on the day specified therein for the publication of the notice of sale, the Secretary shall, *unless otherwise ordered by the Board of Trustees*, cause to be published in the same papers in which the notice provided for in section five shall have been published, a notice substantially as follows, &c.

If, from a matter of convenience or necessity, the publication of an assessment is delayed, a very simple remedy is found in the following section of the law, relating thereto:

Section 14. No assessment duly levied shall be rendered invalid by a failure to make proper publication of the notices hereinbefore provided for, nor by the nonperformance of any act required to be performed in order to enforce the payment of the same; but in case of any substantial error or omission in the course of proceedings for collection, all previous proceedings, except the levying of the assessment, shall be void, and publication shall be begun anew.

Our Patent Agency.

The PATENT AGENCY of the MINING AND SCIENTIFIC PRESS has been signalized with remarkable success during the past two years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of LETTERS PATENT from the United States and foreign Governments cannot be over-rated, and the Proprietors of the PRESS, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

For Advertising Assessments on Saturdays.

Levy your Assessments upon any day EXCEPT FRIDAY.

Advertise the ASSESSMENT NOTICE on the FIRST FOUR SATURDAYS succeeding the day upon which the assessment is levied.

Appoint the day for advertising the DELINQUENT SALE on the FIFTH SATURDAY succeeding the date of levying the assessment.

Appoint the DAY OF SALE on the SEVENTH SATURDAY succeeding the date of levying the assessment, or any day *previous* to the Eighth Saturday.

Assessments ordered upon Saturday afford the Secretary the longest term in which to effect his advertising at the mine.

ENLARGEMENT.—The Mining and Scientific Press has again been enlarged by the addition of a fourth column to every page. It is conducted with ability and enterprise, and is meeting with the constantly increasing patronage which it deserves. There is a straightforwardness and fearlessness about it which we admire.—*S. F. Evangel.*

Mining Notices--Continued.

Aspinwall Gold and Silver Mining Company, Amador District, Lauder County, N. T.

CAUTION.—The public are hereby cautioned against negotiating for the following described Certificates of Stock of the above named company, as the same were sold for delinquent assessments, on the 13th day of August 1864, and will not be transferred on the books of the company, to wit:

Certificates No. 80, 81, 82 and 83, standing in the name of B. T. Hunt. Certificates No. 71, 72, 73, 74, 75, 76 and 77, standing in the name of W. D. Mathenay.

11 JOSEPH HEALY, Secretary.

Buckeye and Old Hickory Consolidated Gold, Silver and Lead Mining Company—Location, Santa Catalina Island, Los Angeles County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 3d day of September, 1864, an assessment (No. 7) of 50 cents per share was levied upon the capital stock of said Company, payable on the 10th day of September, 1864, in United States gold or silver coin, to the Secretary, at his office, No. 324 Clay street, San Francisco, or to J. K. PHILLIPS at the mine.

Any stock upon which said assessment shall remain unpaid on Saturday the 15th day of October, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold, on Thursday the 3d day of November, 1864, at 12 o'clock, to pay the delinquent assessment thereon, together with costs of advertising and the expenses of the sale. By order of the Board of Trustees

B. C. AUSTIN, Secretary.
Office, 324 Clay street, San Francisco. 11-4

POSTPONEMENT.—The advertisement of stock delinquent on the above assessment is hereby postponed until Friday, October 28th, 1864, and the sale thereof until Saturday, November 12th, 1864. By order of the Board of Trustees, made on the 13th day of October, 1864.

16 B. C. AUSTIN, Secretary.

Crown Point Ravine Gold and Silver Mining Company, Gold Hill District, Storey County, Territory of Nevada; office, corner of Washington and Sansome streets San Francisco, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 28th day of September, 1864, an assessment of five dollars per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary at his office, or to JAS. B. COFFEY, Virginia City, Nevada Territory.

Any stock upon which said assessment shall remain unpaid on the 1st day of November, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on the 16th day of November, 1864, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

J. M. BUFFINGTON, Secretary.
Office, Rooms No. 8 & 10, Government House, corner of Sansome and Washington streets, San Francisco, Cal. [14

Citizen's Coal Mining Company, Mount Diablo District, Contra Costa County, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 14th day of October, 1864, an Assessment (No. 10) of $5 per share was levied on the Capital Stock of said Company, payable on the 20th day of October, 1864, in United States gold coin to the Secretary, E. J. PFEIFFER, at the office of the Company, S. W. Corner Post and Dupont streets.

Any stock upon which said Assessment shall remain unpaid on Saturday, the 12th day of November, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday the 26th day of November, 1864, to pay the delinquent Assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

E. J. PFEIFFER, Secretary.
16 4t Office, S. W. Corner, Post and Dupont Sts.

Caledonia Tunnel and Mining Company, Gold Hill District, Nevada Territory. Office, No. 8 & 10, Government House, corner Washington and Sansome streets, San Francisco.

Notice is hereby given that the Annual Meeting of the Stockholders of the Caledonia Tunnel and Mining Company, for the election of Trustees for the ensuing year, will be held at the office of the Secretary, on Monday, November 14th, 1864, at 2 o'clock P. M. of that day.

16-5 J. M. BUFFINGTON, Secretary.

Dashing Wave Gold and Silver Mining Company.
Loomis Gold and Silver Mining Company.
Walker Gold and Silver Mining Company, Amador District, Lauder County, Nevada Territory.

Notice is hereby given that at a meeting of the Board of Trustees of said Companies, held on the 28th day of September, 1864, an assessment of 25 cents per share was levied upon the capital stock of each of said Companies, payable on the 29th day of September, 1864, in United States coin, to the Secretary at his office, or to FRANCIS CLARK, Superintendent at the mine.

Any stock upon which said Assessment shall remain unpaid on Saturday, the 29th day of October, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Monday, the 14th day of November, 1864, at 12 o'clock M., to pay the delinquent assessment thereon, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

WM. HOLLIS, Secretary.
Office, No. 302 Montgomery street, San Francisco, California. 14

POSTPONEMENT.—The above sale is postponed until Monday, November 7th, 1864, at the same place and hour. By order of the Board of Trustees.

17-3t N. DUPERU, Secretary.

NEW VOLUME.—The *Mining and Scientific Press*, published at San Francisco, has entered upon its fifth year of existence. It has been enlarged to a sixteen page paper, and is flourishing like a green bay tree. (We don't insinuate that it wicked.)—*Red Bluff Independent.*

Scott Mining and Exploring Company, Hamholdt County, Nevada Territory. Office, Northeast Corner of Montgomery and Jackson streets, San Francisco.

Notice is hereby given, that at a meeting of the Board Trustees of said company, held on the 28th day of September, 1864, an assessment of 33½ cents per share was levied upon the Capital Stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary at the office of the company.

Any Stock upon which said assessment shall remain unpaid on the 8th day of November 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on the 23d day of November, 1864, to pay the delinquent Assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

V. B. POST, Secretary.

Office, N. E. Corner of Montgomery and Jackson street, Room No. 15. 14-4

Simpson & Bossetle Mining Company—Mines Located in Carson Valley Mining District

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 19th day of September, 1864, an Assessment of 30 cents per share was levied upon the Capital Stock of said Company, payable on the 26th day of September, 1864, in United States gold coin, to the Secretary, at his office, or to Dr. J. W. WATERS, at Markleeville, Alpine County, California.

Any Stock upon which said assessment shall remain unpaid on Saturday, the 22d day of October, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Monday, the 7th day of November, 1864, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees

T. L. BIBBINS, Secretary.

Office, No. 302 Montgomery street, San Francisco. [13-4t

POSTPONEMENT.—The advertisement of stock delinquent on the above assessment is hereby postponed until Saturday, the 29th day of October, 1864, and the sale thereof until Monday, the 14th day of November, 1864. By order of the Board of Trustees.

17 T. L. BIBBINS, Secretary.

Stars and Stripes Copper Mining Company, Rock Creek District, Calaveras County, California

Notice is hereby given, that at a meeting of the Board of Trustees of the said Company, held on the 8th day of October, 1864, an assessment of ten (10) cents per share was levied upon the capital stock of said Company, payable on the 10th day of October, 1864, in United States gold coin, to the Secretary, at his office on Rock Creek.

Any stock upon which said Assessment shall remain unpaid on Saturday the 10th day of November, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on the 26th day of November, 1864, to pay the delinquent Assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

J. J. FINDLEY, Secretary.

Office, Rock Creek, Calaveras County. 16-4

Sisters and Augusta Gold and Silver Mining Companies. Location—Augusta District, Lander County, Nevada Territory.

Notice is hereby given, that at a meeting of the Board of Trustees of said Companies, held on the 19th day of September, 1864, an assessment of 15 cents per share was levied upon the capital stock of said Companies, payable on the First day of October, 1864, in United States gold or silver coin to the Secretary, at the office of said companies, or to JOHN MORREY, Superintendent, at the mine.

Any stock upon which said assessment shall remain unpaid on Saturday the 29th day of October, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 19th day of November, 1864, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

L. C. DODGE, Secretary.

Office No. 406 Front street, San Francisco, Cal. September 20th, 1864. 13-4t

Tallatai Mining Company, Sierra District, Humboldt County, Nevada Territory.

NOTICE.—There are delinquent upon the following described stock on account of Assessment levied on the 6th day of June, 1864, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares	Amount
W H Cherry	6	20	$290 77
E R Righton	92	14	70 00
E R Righton	93	7	35 00
E R Righton	certif not issued	53	885 00
S C Dorn	certif not issued	50	665 50
C Bico	58	50	708 00
C Bico	57	50	706 00
C Bico	58	10	141 20
C Bico	59	10	141 20
C Bico	60	10	141 20
C Bico	81	10	141 20
C Bico	63	20	282 40
C Bico	64	20	282 40
C Bico	65	5	70 80
C Bico	66	5	70 60
C Bico	certif not issued	8½	91 70
C F Ellsworth	47	14	126 00

And in accordance with law, and an order of the Board of Trustees, made on the 13th day of September, 1864, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of the company, No. 8 3 Montgomery street, San Francisco, on Tuesday, the 1st day of November, 1864, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

GEO. A. HILL, Secretary,

Office, No. 623 Montgomery Street, San Francisco, Cal. 16

United States Mining Company, Virginia District, Nevada Territory.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 30th day of September, 1864, an assessment of one dollar per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary, at his office, or to J. B. CORTEY, Virginia, Nevada Territory

Any stock upon which said Assessment shall remain unpaid on Monday the 31st day of October, 1864, will be advertised on that day as delinquent, and, unless payment shall be made before, will be sold on Wednesday the 16th day of November, 1864, at 12 o'clock M., to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

J. M. BUFFINGTON, Secretary.

Office, Rooms No. 8 & 10 Government House, corner of Sansome and Washington sts., San Francisco, Cal. 14

Our Circulation.—THE MINING AND SCIENTIFIC PRESS has a large and permanent subscription list, and enjoys a more universal circulation among stockholders and persons directly interested in mining than any other paper on this coast.

1852. 1864.
TWELFTH YEAR OF PUBLICATION.

THE GOLDEN ERA,

Founded in 1852.

The oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent, and correspondents of distinguished ability in New York, Paris and London.

THE GOLDEN ERA is now enlarged by the addition of eight columns to its pages—and presents fifty-six columns containing the greatest possible variety of Valuable and Entertaining, Original and Selected Matter, all combining to render THE GOLDEN ERA a Literary and Family Journal of surpassing interest and attraction; a Welcome Guest in Cottage and Cabin; the favorite at the fireside in City and Country, the most useful, agreeable altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe, and elsewhere. Every Household in the Mountains and Valleys, the Cities, Towns, and Mining Camps of California and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor.

Serial Romances in the Golden Era.

The most popular Novels of the present day—
"THE DOCTOR'S WIFE," by Miss Braddon.
"OUR MUTUAL FRIEND," by Charles Dickens;
published as Serials, from week to week, in THE GOLDEN ERA, from advance sheets, simultaneously with their appearance in the English and Atlantic Periodicals.

Among the Contributors to the GOLDEN ERA are all the prominent writers of Literary Repute in California, and on the Pacific Coast; also correspondents and contributors of distinguished talent in the Atlantic States and Europe; including "Orpheus C-Kerr," Fitz Hugh Ludlow, G. B. Densmore, "Mark Twain," Dan De Quille, Florence Fane, Miss Emma Hardinge, Sarah E. Carmichael, Annie E. Fitzgerald, "Occasia Owen," Alica Mason, William Simpson, Chas. F. Stoddart, "Ina," H. C. Williston, "Albion," "Fairfax," Bonnevel, Mary Kyle Dallas, Margaret Hosmer, and many other accomplished writers of Fiction, Romance, Novels and Stories, Poetry, Essays, Sketches, etc., etc., comprising an array of Talent and Genius unapproached by any Literary Journal in California, the Atlantic States or Europe.

The proprietors of the GOLDEN ERA announce the receipt of advance Sheets of Miss M. E Braddon's New Novel,

The Doctor's Wife,

The most brilliant effort of the celebrated author of "Aurora Floyd;" "The Outcasts;" "Three Times Dead;" "Lady Audley's Secret;" etc., etc.

"THE DOCTOR'S WIFE," now in course of publication in London, is universally pronounced to be Miss Braddon's greatest production. It will be completed in sixteen numbers of THE GOLDEN ERA.

TO ADVERTISERS!

Best Advertising Medium—The "Golden Era" is the oldest Weekly Journal in California, and indisputably enjoys by far the largest circulation in the city of San Francisco and in the interior of the State.

THE GOLDEN ERA

Is universally read in every city, town, village, and mining and agricultural precinct in California, and offers unusual and unequaled advantages to those who desire to bring their business prominently before the community. Only a limited space is devoted to advertising. All advertising pages are also largely occupied with fresh and interesting reading matter, and no advertisement can escape attention. The charges for advertising are not so large, proportioned to the benefits derived, as those of other papers. Liberal terms will be made with those who advertise for three or six months, or by the year.

GOLDEN ERA POSTAGE.

POSTAGE on the GOLDEN ERA, to Mail Subscribers, in California and throughout all the States and Territories of the Union, per quarter, (3 months).... 5 cts. To be paid quarterly, in advance, either at the Office of Mailing or Delivery.
POSTAGE on the GOLDEN ERA, Single Copies, transient, to be prepaid by stamps..... 2 cts.
POSTAGE on the GOLDEN ERA, to Mail Subscribers in the county (San Francisco) where published..... Free.

Illegal Advertising!

We notice many Secretaries are having their notices of delinquent sales published *weekly* in a *daily* paper. As this is a plain violation of the new law we feel it our duty to warn such parties of this error, and herewith append that section of the "Act Concerning Assessments upon the Stock of Corporations," which governs the publication of delinquent notices.

Section 9. Said notice, when published in a daily or weekly paper, or in both, shall be published as follows: When published in a daily paper, the same shall be published for a period of ten days, excluding Sundays and holidays, previous to the day of sale. When published in a weekly paper, the same shall be published for two weeks previous to the day of sale, the first publication in the weekly being at least fourteen days prior to the day of sale.

By the above extract it will be clearly seen that no delinquent stock can be legally sold by advertising in a daily paper, unless the notice is inserted *daily*.

THE richest individual in England is the Marquis of Westminster, whose daily income is estimated at five thousand dollars. The Rothschilds, four of them, are the richest house in Europe, and their income is estimated at nine millions a year, or a thousand dollars an hour.

ABOUT a million and a half feet of lumber, in logs, ready for the U. S. Government mill, were destroyed by fire on the Truckee, recently. The lumber was to be used in buildings at the Nevada Indian Reservation.

Advertising Circular.

The Proprietors of the MINING AND SCIENTIFIC PRESS would call the especial attention of MINING SECRETARIES, TRUSTEES and SHAREHOLDERS, to a few substantial reasons for the publication of Mining Notices in their journal—the first and only important newspaper of its class published upon this coast.

1st. The PRESS enjoys a large and permanent subscription list, having a more universal circulation among shareholders and men intimately connected with mining interests than any other publication.

2d. Under the present law the publication of all mining notices on Saturday, in a weekly journal, complies as fully with the statutes as a daily publication. It is generally found to be equally as convenient for secretaries, and decidedly preferable to stockholders who have not time to examine throughout every issue of a daily.

3d. Economy in mining should always be looked upon with favor, and the cost for weekly advertising in the PRESS is less by one half than the rates of any other journal in this city possessing a respectable circulation.

4th. The publishers of the PRESS, making the mining interest their especial care, take particular pains to assist in the avoidance of errors in advertising. Our print is also more clear and perfect than can be expected in such papers as are hurriedly issued from cylinder presses.

5th. Our "Shareholders' Directory" forms a complete index of all mining notices published in San Francisco, by reference to which shareholders can at once see if their company is advertised, and determine whether the same is inserted in the PRESS or some other paper.

6th. Many copies of the PRESS are bound by prominent professional men, mechanics, secretaries, brokers, shareholders and others, as an important record for future reference, thereby rendering advertising, of every class, in its columns, of peculiar and permanent value.

7th. The benefit of having all mining notices consolidated in one newspaper, for the common convenience of shareholders, secretaries, and others who have occasion to refer to the same, is obvious. With this view we have established our rates at only fair, living prices, believing that a journal like ours, untrammeled by party, creed, or prejudice, is the only medium which can reasonably ask for such a consolidation of mining patronage.

8th. Our rates are uniform as well as moderate. Advertisements will be taken from the forms and printed on slips or as circulars, for sending personal notification to stockholders, whenever desired, at $1 per hundred.

9th. Advertisements in the columns of the PRESS, after their first insertion, are arranged alphabetically. Our present list is equalled only in one instance by that of any other journal. Shareholders, as well as strangers, naturally turn their attention to a mining journal for information concerning the mines and mining matters.

10th. Blanks for filling out advertisements of assessments or notices of sale are furnished gratis. Our rates of advertising, and any other information desired, will be freely given upon application at the office.

LAST, BUT NOT LEAST.—Our sheet (having been recently enlarged to the size of Harpers' Weekly) is now only equalled in its dimensions by one mining paper in existence—the *London Mining Journal*. Published in this, the greatest mining field of the world, we desire that the PRESS shall have no superior. We can only realize our cherished object of building up a reliable advocate of the science and business of mining, which will be of just honor and profit to our community, by experience and liberal patronage. The bestowal of such favors only as naturally belong to us, and which it is clearly for the benefit of the mining fraternity to extend, is all that is requisite, and we are confident we shall receive it.

DEWEY & CO., PUBLISHERS And Patent Solicitors.

SAN FRANCISCO, SATURDAY, OCTOBER 29, 1864.

VOLUME IX. Number 18.

S. F. Mechanics' Fair Reports.

COMMITTEE REPORTS

OF THE SAN FRANCISCO MECHANICS' INSTITUTE INDUSTRIAL EXHIBITION OF 1864.

Class I.

Agricultural Implements and Machinery.

COMMITTEE:

D. L. PERKINS, M. HUNGERFORD, A. R. MARDEN.

Report.

The Committee of Examination in this department recommend awards as follows:—

Premium to J. Price, of Petaluma, for best Hay Press.

Premium to H. R. Hule, of Alameda county, for best Gang Plow.

Premium to M. Munral, for Wine Press. [The Executive Board do not find the name of Mr. Muural upon the records as an exhibitor, and will accordingly hold the premium for identification.]

Premium to J. B. Barker for model of steam power machine, designed for making extensive earth excavations and embankments.

Premium to A. Huuter for Patent Grain Separator.

Premium to W. Wadsworth, of Sacrameuto, for patented "American" Soil Tiller.

Premium to Joel Halstead, for Wine and Cider Mill, with Press combined.

The committee distinguish by honorable mention—

The Hay Press exhibited by G. C. Paine.

The Patent Seed Pinator and Cultivator exhibited by D. & H. A. Winter.

The Gang Plow exhibited by L. Holloway.

And the Wine Press and Mill, combined, exhibited by E. W. Walton, of Amador county.

J. D. Arthur & Son, San Francisco, exhibit a finely finished Reaper of the Seymour & Morgan pattern, a model of the "Giant," and an assortment of plows—all of Eastern manufacture.

Hawley & Co., San Francisco, exhibit one of the "Buckeye" Mowing Machines and a number of patent plows—imported.

A Cotton Gin, farnished by the firm of Melrose, Zorn & Co., was in daily operation, during the Fair, upon samples of cotton raised by Jackson & Johuson, on the Sacramento river (where, with an experience of two years, under disadvantages, they believe they can yet raise it successfully and profitably). The cotton-raising enterprizes at the Islands and in Mexico, if not in California, will make a market here for the indispensable Gin, which can as well be built here as imported.

[Premium awarded to Z. Sikes, of Santa Clara, for Gage's Roller and Grain Drill; to Wm. Saunders, for Improved Whiffle-Trees; and to F. B. Lamh, for Sheep Shearing Machine, cannot be allowed by the Executive Board, the articles named having been entered as of Eastern manufacture. They will, therefore, rank with articles honorably mentioned.]

Class II.

Quartz Mining Machinery.

COMMITTEE:

W. T. GARRATT, H. P. WAKELEE, E. M. RADCLIFF, OTTOVIANO GORI, GEO. JOHNSON, O. BELDEN.

Report.

If any evidence were needed to show the importance of the great, growing and, we may add, vital interest of the Pacific coast, MINING, we have only to point to the numerous machines exhibited in this department of the Exhibition just closed, all of which possess great merit, and many are so similar in their construction that in some cases our task to determine to which the premium should be awarded has been most difficult.

Quartz Crusher or Rock Breaker.—We award a premium to W. W. Hanscom, for his crusher, which, in our opinion, offers the greatest facility for adjustment, to reduce the ore fine or coarse, as may be required, and which is the principal distinction we can draw between this and the well known Blake Crusher.

To Moore's Improved Howell Crusher we award a premium. The result of experimental running of this machine at the Exhibition, showed that it reduced quartz to an impalpable powder at the rate of about one ton per hour. The inventor claims that "the action of the machine is rapid, safe and effective, and runs with nine-horse power to crush fifteen hundred pounds of quartz per hour. The shoes on the arm can be replaced in half an hour, at a very small expense. The machine requires no foundation to stand upon, but can be placed on a common floor, and can be packed on mules, as the heaviest piece weighs only 300 pounds. If the quartz is required to be pulverized only to the ordinary fineness to enter the grinding pans, a crusher can be built to reduce one ton of quartz per hour, to be driven by a six-horse power engine."

To W. D. Farrand we award a premium for his Amalgamator.

Honorable mention of Wheeler & Randall's, Varney's, and Hepburn & Peterson's "Reducers and Crushers." All these pans are in practical use, and each has its advocates among the miners.

E. D. Johnson presented a model of a very ingenious machine, under the name of the "Novelty Amalgamator." We regret it did not appear in larger size. As a model, its practical value could not be ascertained.

To J. B. Baux (Baux & Guiod's Separator and Amalgamator) we award a premium as separator.

To E. B. Prater we award a premium for his Concentrator.

Honorable mention of Varney's, Hepburn's, and Hunter's Seperator.

To J. Dredie we award a premium for his patent lining of the "Freiburg Amalgamating Barrel," which consists of blocks of wood set on end, thereby greatly increasing its durability and effective operation as an amalgamator.

To W. W. Duan we award a premium for his Rock Drill.

To Oscar Lewis we award a premium for his model of Wheeler & Randall's Amalgamating Pan; the workmanship of which is superior to anything we have seen of the kind.

Honorable mention of R. S. Eells' model of his "Percussion Quartz Mill."

Honorable mention of D. Fauchery's Quartz Grinder, for working wet or dry. This, with his "Crocodile Quartz Crusher," forms a complete mill.

To J. M. Beth we award a premium as Reducer, in his Reducer and Amalgamator.

Honorable mention of Judge Rix's Trip Hammer Crusher.

All of which is respectfully submitted.

San Francisco, Oct. 8th, 1864.

Class III.

Manufacturing Machinery and Steam Engines.

COMMITTEE:

WM. MCKIBBEN, JAS. MOORE, WM. SCHMOLZ, C. C. DENNIS, A. W. STRATTON.

Report.

The Exhibition in this department comprised a great variety of articles of substantial and beautiful workmanship, which bear ample evidence that we have passed the period of dependence on workshops abroad. The machinery, tools, models &c., adapted to a great variety of uses, the valuable inventions and new improvements, are in the highest degree creditable to the skill and resources of our home manufactures and mechanics.

J. Scoville—Exhibits a Portable Clamp Drill, which is well made, simple, practical and in our judgment deserves a Premium.

Melrose Zorn & Co.—Exhibit among other imported articles a Steam Guage and a Counter, which are accurately and durably made.

Meeker, Jones & Co—Exhibit an Imported Patent Spoke Borer, well adapted for the use of wheelwrights.

Wm. T. Garratt, S. F.—Exhibits Brass Work. The stock in this lot embraces globe valves, water cocks, water gauges, steam whistles, hydraulic pipes, engine torches hose couplings, Reeves' Improved oil globes, &c., &c. The various sizes and patterns of the articles enumerated, together with others, contributed to make this one of the most noticeable lots in the Exhibition. Mr. Garratt's globe valves are superior in style, durability, and safety to any imported, and the rich metal, fine finish and quality of all his work will compare favorably with the work from any manufactory abroad, and attests the excellence attained in this branch of home industry. It should receive a Premium.

Conroy & O'Connor, S. F.—Exhibit a large assortment of imported vices, anvils, cast steel bells &c., &c., together with a Patent Chain Pully Purchase, which with one of the same pattern exhibited by Coffee & Ridson, was practically and satisfactorily tested by constant use in setting and adjusting the heavy machinery in the Exhibition.

Fargo & Babcock, S. F.—Exhibit one of Stoddard's Shingle Machines, which is worthy the attention of persons interested.

David Stoddard, S. F.—Exhibits a Blacksmiths' Drill of ingenious construction, compact and portable, designed to work either by hand or power. We consider it worthy of a Premium.

A. J. Frick, S. F.—Exhibits a Patent Packing and Filling Machine, which performs its work advantageously and well.

G. W. Guion, S. F.—Exhibits a large and full assortment of imported tools for almost every mechanical trade.

J. Heady, S. F.—A Circular Gang Saw Mill. This is one of the most interesting machines in the Exhibition. Two large Circular Saws working upon parallel horizontal shafts, set one above the other to cut in the same line, enable it to saw logs of great thickness, while the horizontal gang of six saws, working on an upright shaft, operate in advance of the perpendicular saws and before the piece being cut is severed from the log. The saws in the horizontal gang can be adjusted to cut any required thickness of scantling, which, being firmly held to the solid log until severed by the vertical cut cannot spring or bead to bind and obstruct the saws. An original arrangement for truing the saws when running, is attached to the frame, and is worked by a lever without danger of injury to the operator.

It is claimed that the mill is capable of turning out 25,000 feet of inch boards or 30,000 feet of scantling every twelve hours, making more lumber from the log at less proportionate cost of labor and power than any other. It is due Messrs. Hinkley & Co., the builders, that the committee should bear testimony to the admirable proportions and fittings of every part of this substantial and highly useful piece of mechanism, and we recommend a Premium.

Wm. Dorney, San Francisco.—A Patent Saw-Filing Machine, which performs the operation of filing circular saws more accurately and expeditiously than it can be done by hand. We would award it a Premium.

F. W. Spaulding, San Francisco.—Two Patent Tooth Circular Saws—very appropriately set for exhibition on Hinckley & Co.'s mill. The preference which Mr. Spaulding's tooth saws have found with mill men and manufacturers of lumber, sufficiently attests their superiority, the advantages being a saving of cost for files and time in keeping them in order, while the original size of the saw is never reduced by wear, never requires "gumming," is not liable to spring and heat, and from the better cutting form of the teeth, will run with less power and do better work than the ordinary saw. The teeth are of better material than is used in the plate; their temper can always be exactly adapted to the requirements, and when broken or worn they can be readily extracted and replaced, without strain on the plate or removing it from its seat on the shaft. Mr. Spaulding is well entitled to a Premium.

Pacific Iron Works, San Francisco.—Green's Patent Steam Engine. This engine, worked for running the machinery at the Fair, was manufactured by Goddard & Co., under the patent of H. J. Green, of Providence, R. I., for a variable cut-off. The cylinder is 18 by 36. The mechanical arrangement is very simple and effective, taking the steam from the steam-chest on top of the cylinder through ports and a common side valve, the valves on each end of the cylinder being worked by an independent shaft and arm, used only for the steam, the exhaust being an independent valve in the side of the cylinder driven by a separate eccentric and rod. This arrangement leaves the steam valves independent of each other and of the exhaust, and their movement entirely under the control of the governor. The effect of this arrangement is to measure the steam, and admit it at each end of the cylinder in small quantities, as is required by the work to be done (not withdrawing the steam, as is done by the ordinary governor valve, but admitting it at nearly the same pressure as that indicated by the steam guage on the boilers.) It is claimed by the inventors and the manufacturers of this engine that it will save fully thirty per cent. of fuel on a given amount of work as compared with ordinary engines.

The committee had an opportunity to test all the claims thoroughly; but the correctness of the principle is so obvious, and the working of the engine so perfect, that we do not doubt it offers a great desideratum in the way of steam power, and particularly on the Pacific coast. The engine worked effectively and economically during the Fair. The fine proportion, superior finish and perfection of workmanship on this engine deserve a Premium.

Van Winkle & Duncan, Sac.—Patent Tire Upsetting Machine. Answers the purpose well, and is a valuable machine for blacksmiths' use.

Devoe, Dinsmore & Co., S. F.—A Sugar Mill, model, interesting to grinders of Sugar Cane.

Peck & Venard, S. F.—Patent Preparation for cleaning steam boilers. Will require a practical test in both new and old boilers, to determine its value, which is very great if it effects what is claimed.

W. D. Root, S. F.—Tire Upsetter and Punch combined. Needs improvement.

Z. Rice, S. F.—Sample case of Lock work and mechanics' implements of practical utility.

J. Bien, S. F.—A Combination Lock. Effective and simple in arrangement and an excellent piece of mechanical work, deserving Premium.

D. Dodge, S. F.—Two of Tapley's self-feeding Hand Sawing Machines (imported). They operate perfectly, and would be useful in the shops of most wood workers.

H. S. Smith, S. F.—Two Sets Dunbar's Patent Piston Packing Rings. This packing has been tried and gives entire satisfaction.

Andrew Stevens, Vulcan Iron Works, San Francisco.—Piston Packing Rings. A California invention, applied to a number of engines in this State, and giving satisfaction in every case. One great advantage steam packing has over springs is, that it is entirely self-acting, and avoids the danger of inexperienced men cutting the cylinders and using up power by setting up the springs too much. Premium.

Pacific Iron Works, San Francisco.—A Bryan Five-Stamp Battery. Built in a very substantial manner, and provided with all the latest improvements.

Reeve's Improved Oil Globe, for oiling cylinders under steam pressure. By turning the handle of the plug in an upright position, the pressure of the steam and springs seal the valve, cutting off the communication between the cylinder and globe, when the globe is filled with oil by turning the handle down, and the communication is cut off between the cup and globe.

The eccentric upon the plug is brought to bear on the stem of the valve, which unseats it, and may be so graduated as to admit more or less oil, as may be desired. Premium.

A. S. Hallidie & Co., San Francisco.—Improved Wire Rope Machine, invented by Mr. A. S. Hallidie, for the manufacture of wire rope and cordage, and of wire submarine telegraph cables.

It is different from any machine of the kind heretofore employed; and on examination, in actual operation, we find very many novelties in detail, while the general arrangement of the machine itself is entirely new. It possesses several important advantages over the best machine of this class. The bobbins which contain the wires (there are seven in the machine exhibited) are placed in horizontal frames, in a line immediately in front of one another, and, with the exception of the motion caused by drawing off of the wire, are motionless.

[Remark.—In the latest improved machines the bobbins are placed in vertical frames, and revolve at a great velocity around a center bobbins.]

By this arrangement the attendant can examine the bobbins and wire at any time without stopping the machine, and the frame of the machine under examination being no larger than sufficient to revolve free of the bobbins, offer a resistance to the atmosphere in proportion to its diameter, which is less than one sixth of the vertical machine of the same capacity.

In the machine exhibited, the cord or rope is formed by the frame, which is light and simple, revolving around the bobbins, and inside a series of anti-friction pulleys. The wires, after leaving the bobbins, pass through a hollow spindle in the center of the frame to its outer circumference, then along the length of the frame, being guided on its way by means of small pulleys or guideholes to the "top" or "former," when they come together, and as the frame revolves the wires are laid together in the cord. The cord then passes half around a horizontal sheeve, to which is attached a register, or indicator (this ingenious register is accurately made by J. Roach), which registers the length of the cord as it is made; it then passes to the drawing-off gear, regulating the lay of the rope or the number of turns per inch, thence to the coiling up reel, which coils it up as fast as it is drawn off. The machine does its work well and expeditiously, running at a velocity of six hundred per minute, the machine contains 150 pounds of wire at a time, and is capable of making 10,000 yards of strand per day of ten hours.

[Written for the Mining and Scientific Press.]

Copper Mining and Smelting in Copperopolis.

Editors Mining Press:—The mines of this district have heretofore been fully and repeatedly described, and it would therefore be superfluous to describe them again. It is nearly three years since I previously visited the mines, at which time they were very little developed. Since that time their aspects and prospects have changed considerably, and what was then only in prospect is now in reality. The mines at present are yielding a large amount of shipping ore, and one of them, at least, pays the shareholders a handsome return. I am pleased to find that my former prophecy and expectations have been realized. The richness of the ore allows the mines to be worked by the present system, which is as primitive as in most of the English mines, where they use hardly any machinery for sorting or dressing the ore. Here in Copperopolis they do not use any whatever, but assort all by hand, which, at the present price of labor, could as well be done for less than half the present cost. Perhaps the proprietors act upon the doctrine of the Cornishman, who once said to me in Cornwall, "What's the use of buying labor-saving machines as long as the mine pays a dividend?"

It is evident, however, that the proprietors of the Union and Keystone mines intend, eventually, to bring science and skilled labor to bear on their poorer ores. The Union Company have begun to smelt, and the Keystone to concentrate, and I will endeavor to give you, in a few words, a description of the works, experiments and results of the operation and their future.

The Keystone have first erected dressing or concentrating works. This is a very wise move in the right direction, and by far more profitable on poor ores than smelting; but there is something wanting yet in those newly-erected works, and that is, in the first place, some other machinery, and in the second, somebody to manage the dressing works, who, at least, know the first rudiments of gravitation. The present old-fashioned jiggers and the stationary round buddle are not what is required, and time will teach them that such works won't pay. No regard is paid to the separation of the ore, nor to the slime dressing; and I should advise them to alter and complete their works as soon as they can see fit to do so, and I am sure it will repay their trouble. I am sure, as soon as they get proper dressing machinery, they will be able to work the very lowest grade of ores.

At the Union, they have erected two small blast furnaces, one of which had been in operation for two days, at the time of my visit, with very cheering prospects for the smeltering. The ore is first roasted in open heaps, and then smelted with charcoal, without the addition of any flux. The matto is sometimes richer and sometimes poorer, and looks, so far, all very satisfactory; but we don't know, as yet, at what sacrifice of copper the slag is formed. It would be very gratifying if the ores of that district could be smelted without the use of any flux; but I doubt whether that can be done. Smelters have provided for a flux a quantity of soda casks, from the acid works, which, in my humble opinion, is the meanest flux they could get, even if they have it for nothing. There is no doubt copper-smelting will pay in California, if carried out by men of experience. Blast furnaces are far preferable to flame or so-called reverberatory furnaces. I saw besides those in Copperopolis several other mines, which have good and paying ore, which won't pay to ship, but which will pay to be worked in this country, not by direct smelting, as they began in the Union, but by first concentrating the ore and then smelting. Here is the point where we need cheap labor, or labor-saving machines, and those of quite a different construction from those employed at Copperopolis, which are but counterparts of those used in the English or Cornish mode of dressing, and which can be employed only in a country like Great Britain, where laboring girls and boys get but twelve or sixteen cents per day. Even in Cornwall they might save 100 per cent. on the labor if they would adopt machinery such as is used in Germany and Australia. But Cornish miners will not adopt anything that is new, especially when it comes from abroad.

A properly constructed set of works for dressing copper ores, supplied with all the modern improvements, where neither much hand-labor is used, nor metal wasted in the refuse, is the only means by which the mines which yield less than 10 per cent. ore can be made profitable to the shareholders.

J. Mosheimer.

MINING IN AUSTRALIA.

It appears from late accounts from Australia that mining interests in that colony have considerably revived of late. A recent prolonged strike among the miners at the Moonta and Wallaroo mines has been amicably adjusted between the strikers and employers, and since work has been commenced in those districts, evidences have accumulated which indicate that the yield of the mines there will soon be fully doubled. Quite a number of individual mines (quartz mines) are enumerated, in which the indications are pronounced encouraging.

Dates from Adelaide state that Mr. Hargreaves, the gold discoverer, has recently returned from his tour of the colony. He has not succeeded in finding a gold-field, although in many localities he has found gold, and in places of limited extent has met with it in paying quantities. He thinks they have in South Australia many fine auriferous quartz reefs, which, if they were in Victoria, would be profitably worked. Mr. Hargreaves found bismuth in many places, and confirms generally the account given in Mr. Anstiu's book on the mines, as to the extreme richness in copper deposits of the country north of Port Augusta, especially in the neighborhood of the Yudanamutana and Daly.

We clip the following items from a correspondence of the London *Mining Journal:*

Copper Smelting.—The representative of a wealthy Glasgow company (Mr. Tregoning) has recently arrived in the colony, with a view of ascertaining what facilities exist for the introduction of Henderson's patent process for the reduction of low-class copper ores. We believe the patent was registered in the colony some time since, and that it has been successfully brought into operation in the mother country, where ores of less than *two per cent.* have been profitably treated. Tens of thousands of tons of that description, and of even a higher percentage, will be readily available in this colony, so that no difficulty on the score of supply need be apprehended by the company. Mr. Tregoning proceeds at once to the Burra and Kapunda mines, in furtherance of the object of his mission, and will, as soon as possible afterwards, visit Wallaroo, Moonta, and the northern districts.

Antimony.—A commencement has been made in the M'Ivor district of smelting antimony under a new process, patented here, by which, so simple is it, two men can turn out about 80 tons of the metal in a week. The ore abounds in the district named, and the process is said to be so economical that the metal can be shipped for England, in large quantities, at a very low rate.

Patent Explosive Compound, or Powder.—A patent explosive compound, or new blasting powder, was practically tested, in the presence of a number of gentlemen, by a series of experiments, at the Glen Osmond Stone Quarries. One difference between the new and ordinary powder is that the new compound, weight for weight with the common powder, will do one-third more work, or, as tested in the quarries, 3 lbs. of the new are equal to 4 lbs. of the common powder. The proprietors are of the opinion that the new compound can be sold at 6½d. in Adelaide.

Yudanamutana Mines.—The Yudanamutana and Blinman mines are still going on well. Ore is being raised about as fast as it can be smelted. Two furnaces are in full work, and two more in course of erection. There are some 4,000 tons of ores of different qualities at grass.

The Gold Fields.—The yields from the older reefs generally is well maintained, if the number of exceptionally large returns is not so great as it used to be. The Pyrenees reefs have not often been distinguished in this way during the last year, but a lot of 11 tons from one of these lately produced 60 ozs. Many of the best claims on the Inglewood reefs have been worked down to the water level, this being the reason why they are now so seldom heard of; and we have often had before to notice the extraordinary delay which takes place in providing machinery under such circumstances. As an addition to the many proofs already afforded that this is not on account of any danger of the yield falling below this line; we may refer to Tarnagulla, not far away, where a late crushing of 200 tons of stone from a claim on Poverty Reef gave an average of nearly 6 ozs. to the ton, this stone having been raised from a depth of 355 ft, and the yield being the largest yet obtained from this claim, though not from the reef, which has so often been specially mentioned for the production of monster cakes of gold. Some of the shafts on this reef are now down more than 400 feet, and so far the stone is found to improve in value as the depth of sinking increases. Some of the claims in the Tarregower district are still yielding largely, and the last rich lode struck in one of these, only at a depth of 120 ft., however, has averaged 6¾ ozs. to the ton. None of the Ballarat companies have declared very large dividends lately, the Koh-i-noor Company having paid the largest—45*l.* per share for one fortnight, and 24*l.* per share for the other; the gold washed out during the first fortnight having, however, been sufficient to have allowed of a dividend of 120*l.* per share, but for the liabilities to be cleared off. The Great Extended paid 18*l.* and 16*l.* per share, and the Cosmopolitan 13*l.* and 10*l.* per share, for the respective periods; and the Nelson Company 33*l.* per share for one fortnight. The Band of Hope Company broke into the gutter in their claim, a few days since, and found it to be so rich that large dividends are looked for, and shares at once jumped up to a high price. The neighborhood of Moliagul has produced the largest nugget found latterly, weighing, when freed from dirt, 126 ozs. 19 dwts., and a couple of weeks before one of 50 ozs. was found near the same place. A nugget weighing 7 lbs. is also said to have been found near Kingower, and another of 60 ozs. at Redwood.

Copper.—Advices from Sydney speak encouragingly of the copper mines in that quarter, also of the quantity and character of the coal obtained for smelting purposes.

Bill for the Survey and Sale of Mineral Lands.

The following Act of Congress, passed during its last session, we deem of sufficient importance to place upon record in our paper, for the information of actual miners:—

A bill for the survey and sale of the mineral lands, and to extend the right of pre-emption thereto.

Be it enacted by the Senate and House of Representatives, of the United States of America in Congress assembled, That the President of the United States shall, as soon as may be after the passage of this act, order a survey of the public lands hitherto designated as "mineral lands," and the Surveyor General of the United States in each State and Territory containing such lands shall proceed to survey or subdivide said mineral lands into townships, sections, quarter sections, sixteenths of sections, and tracts of ten and five acres each, and such lesser fractions of a section as the Secretary of the Interior shall direct. Or whenever, in the opinion of the Secretary of the Interior, a departure from the rectangular mode of surveying and subdividing the public lands would promote the public interest, he may direct such change to be made in the mode of surveying and designating the said lands as he may deem proper with reference to the existence of timber, mountains, mineral deposits, and the advantages of water privileges; and after a plat of said survey and subdivision is returned to the register of the land office in any district where mineral lands are situated, any person or association of persons, having previously occupied and improved a claim or claims, according to the local custom or rules of miners in such district, and in regard to whose possession there is or shall be no controversy or opposing claim, may enter either of said subdivisions, not exceeding —— acres in any single entry, upon the payment to the receiver of the land office of — dollars per acre, and shall be entitled to receive a patent for the same, subject to the approval of the General Land Office; and thereafter mineral lands remaining unsold, and in regard to which there is no controversy or opposing claim, may be in like manner entered by individuals, or association of individuals, who shall prove to the satisfaction of the local land office the facts as aforesaid of actual possession and improvement, according to the local custom or rules of miners: Provided, That the laws and regulations of the General Land Office, now and hereafter in force governing the disposition of public lands, shall be applicable in the disposition of mineral lands, when not inconsistent with the provisions of this act: And provided further, That the mineral lands in the public domain prior to appropriation and sale, both surveyed and unsurveyed, are hereby declared to be free and open to exploration and occupation by all citizens and those who have declared their intention to become citizens, subject to such regulations as may be prescribed by law, and subject also to the local custom or rules of miners in the several mining districts, so far as the same may not be in conflict with the laws of the United States, or such executive regulations as may be made in pursuance thereof.

Sec. 2. And be it further enacted, That wherever, prior to the passage of this act, upon the lands heretofore designated as mineral lands which have been excluded from survey and sale, there have been homesteads made by citizens of the United States, or persons who have declared their intentions to become citizens, which homesteads have been made, improved, and used for agricultural purposes, and upon which there have been no valuable mines of gold, silver, cinnabar, platinum, or copper discovered, or which are properly agricultural lands, the said settlers or owners of such homesteads shall have a right of pre-emption thereto, and shall be entitled to purchase the same at the price of one dollar and twenty-five cents per acre, and in quantity not to exceed one hundred and sixty acres.

Sec. 3. And be it further enacted, That where, by priority of possession, rights to the use of water for mining, agricultural, manufacturing, or other purposes, have vested and accrued, and the same are recognized and acknowledged by the local customs, laws, and decisions of courts, the said possessors and owners of such vested rights shall be maintained and protected in the same; and the right of way for the construction of ditches and canals for the purposes aforesaid are hereby acknowledged and confirmed.

Sec. 4. And be it further enacted, That upon the survey of the lands aforesaid, the Secretary of the Interior may designate and set apart such portions of the said lands as are clearly agricultural lands, which lands shall thereafter be subject to pre-emption and sale as other public lands of the United States, and subject to all the laws and regulations applicable to the same. And the sum of —— dollars, or as much of the same as may be necessary, is hereby appropriated, out of any moneys in the treasury not otherwise appropriated, for the purpose of defraying the expenses incident to this act.

Exciting Scene at a Menagerie.—On Tuesday evening, while Mabie's Menagerie was on exhibition in this city, says the Council Bluff *Bugle* of August 3d, a violent storm sprung up, which blew down the pavilion, which immediately took fire and was nearly all consumed. The accident took place in the midst of the exhibition, and there were from one to two thousand people in the pavilion. It is impossible to describe the confusion which took place. Men, women and children were buried under the canvas; but, fortunately, the centre poles and braces fell with one end upon the cages of the wild beasts, so as to allow a large portion of the audience to escape. The canvas on the north side was lifted up bodily and carried over the heads of the audience into the centre of the ring, while the top canvas, falling upon the kerosene lamps, immediately took fire, and at one time there was great danger of many being consumed by the fast-spreading flames; but, fortunately, all escaped, and not a man, woman or child was seriously hurt. Such confusion was never witnessed in this city. Men calling for their wives and wives for their husbands, mothers for their children and children for their mothers—all was confusion. Just at this time two cages, which had been placed together to form a den of wild beasts, which Prof. Sears enters during the exhibition, became separated, and the back door being open, out leaped a huge lioness; then arose the cry of "a lion out." Then there was confusion, worse confounded, and a stampede took place. The keeper of the lion caught it around the neck, another man belonging to the concern jumped into the cage and threw the leopard (which being in the same cage with the lion was about to escape) down in a corner and held it while the bystanders closed the cage, and all was quiet. "Nobody hurt."

The Contract System.—Mr. Thomas Faull, formerly Superintendent of the New Almaden quicksilver mines, is at present in this Territory examining our mines. He is a miner of thirty years experience, therefore his opinion in regard to the proper mode of working our mines ought to have some weight with our owners and superintendents of mines. From a conversation with him we infer that in his opinion the best way to reconcile owners and workmen here would be to have all kinds of work done by contract. Then there would be no trouble. An industrious man might make two or three dollars per day more than at present, while a lazy miner would soon find his proper level. We imagine the great difficulty in the way of the contract system at present to be in the fact that few of the Superintendents know enough about mining to let contracts. They don't know just how much work a man ought to do in a day. But they soon learn. They might give the miners too good a bargain at first, but in a short time they would strike about the fair thing. No matter how hard a miner may work, or how skillful he may be, he can earn but four dollars per day under the present system; under the contract system his hard labor and skill might bring him six or eight dollars per day. All the leading mines of Europe are worked under the contract system.—*Territorial Enterprise.*

The imports at New York so far, this year are forty million dollars over last year in the same time, and the exports, reckoned in currency, have increased sixteen millions.

Mining Summary.

CALIFORNIA.

The Nevada *Gazette* speaks of another very rich, extensive and well-defined lead of gold-bearing quartz, which was discovered, a few days since, by Messrs. Tayler & Hammond, about a quarter of a mile south of Churronat's mill, on Little Deer creek. The ledge is about two feet wide, and prospects exceedingly well. W. H. Weeks, Esq., is one of the original locators. About a dozen promising ledges have lately been located in the same vicinity.

The editor of the Grass Valley *National* has seen, at Findley's banking house, some quartz specimens taken from a mine at Union Hill, which is owned by H. Burdett and Geo. D. Roberts. He says: "The quartz is literally filled with gold, and the specimens shewn us are equal to any we have ever seen in this section. This quartz was found at a distance of ten feet from the earth's surface, where the ledge is about eighteen inches thick. Messrs. Burdett & Roberts, who undoubtedly have a magnificent mine, are making preparations to work it extensively."

The Marysville *Appeal* says: "Some very rich gold-bearing quartz, was taken out of the claim of the Oregon City Quartz Mining Company, located about seven miles above Oroville, at the head of Oregon Gulch. This claim is owned by a company of Marysvillians, who commenced to erect a mill on the claim in June last—which has been completed—and the company have made a respectable showing for the time they have run it. They cleaned up for four and a-half days' run, last week, the snug little sum of $1,000, which we pronounce good for an eight-stamp mill. The quartz is rich and the gold very fine, being worth $18.35 per ounce. Dr. Teegarden is the Superintendent of the mine, and with his careful and economical management we think it a "good thing," and wish them good luck.

Shasta.—The *Courier* furnishes the following:—The Original Bully Hill Company have got their lower tunnel in 425 feet, and struck a lode of fine looking mineral 250 feet below the surface. They are now five feet into the lode, with most flattering prospects. Other tunnels in this district are progressing, and the success on the Bully Hill has raised high hopes of general good results from their enterprise. Pittsburg stocks are going up. The Highland Quartz Company, of French Gulch, are taking out some splendid rock. This mill is paying largely, and more are wanted in that vicinity to work other lodes of even greater richness.

WASHOE.

The Roxby mine is the north extension of the Justis. The *Enterprise* gives the following particulars with regard to it:—The company now have a tunnel in to the distance of 450 feet. About 220 feet from the mouth of the tunnel they cut through a very promising lead, and on going 50 feet further cut a second and equally fine-looking vein. On both these veins they are now sinking, the shafts being in the tunnel. The ore contains both gold and silver, but not as yet in paying quantities. The rock so closely resembles that taken from the Justis that specimens from the two mines are apt to be confounded by the best judges. As the veins are followed down they greatly increase in width and the ore becomes much purer and richer. The company have been vigorously at work, day and night, for the development of their claim, for over a year, during which time they have expended a large amount of money. They claim five distinct ledges, all being what are called blind.

The Mexican mine has now a main shaft 406 feet deep. The editor of the Virginia *Union* recently visited this mine, and reports as follows:—From the shaft to the ledge, in the lower level, it is 90 feet, and here we find the great Comstock ledge 200 feet in thickness, including a "horse" of 60 feet, which separates the main ledge into what they call the "front" and "back" ledges. The back ledge is the one from which the richest ore has been taken, and at the lowest depth where it is being worked it is less than ten feet in thickness, but yields ore from which the richest portion is selected for shipment to Europe. This ore pays over $2,000 to the ton, and contains some valuable minerals that would be lost by any of the appliances we have at present for the reduction of ores. It is the hard black sulphuret ore and native silver, and wire silver is plainly to be seen among it. The front ledge is softer and more easily worked, and does not pay so well. The "horse" is composed of sound hard quartz, and a little porphyry, and among it some very good ore has been found at this lower level, and in one place a large chamber has been worked out, which paid rich. From the lower level up, the ledge is pretty thoroughly worked, by regular "benches," keeping from 35 to 40 men constantly employed. The rich "pay streaks" have become so reduced in size as almost to have run out altogether, but the pay streak which has been found in the "horse," denotes nothing bad, certainly, but shows that it may be found eventually to be the richest part of the ledge. But the ledge above the lower level being pretty thoroughly worked, it now remains to "go down" for bodies of rich ore. We understand the Ophir Company, which owns the ledge on either side of the Mexican, are about entering into an arrangement with the Mexican Company to join with them in sinking the shaft 400 feet deeper, and afterwards use the same shaft in common.

The Washoe Consolidated Company, are rapidly developing their mine. The company are erecting first class machinery, at an expense of about $50,000.

The Challar is now taking out more really valuable ore than at any time in the history of the mine.

At Silver Mountain, there is at present great activity in mining matters. The Carson City *Post*, of a late date, says:—We visited, on Tuesday last, the arastras now being constructed on Silver creek, a short distance below Silver Mountain, by Henry Van Horn, in connection with Capt. Nye, of San Francisco, who, we believe, owns a half interest. There are two arastras, nine feet in diameter, the bottoms of which are cast-iron, with eight slots in each, two inches in width by three in depth, running from the center to the circumference; the bottoms are elevated about two feet from the ground, supported by substantial brick work, and calculated for a furnace beneath to heat the pulp while being crushed. The motive power is a water wheel 36 feet in diameter, 5 feet breast, with a spur wheel operating a line or shaft. They are calculated to pulverize one ton of rock each in twelve hours. The rock to be worked is from the George Washington, and Mr. Van Horn informed us that, from various assays, he was convinced it would average about $100 per ton. He commenced the wheel six weeks since, and the whole will be completed next week, at a cost of $4,000.

The Ophir Company have received a 350-horse power engine, which will shortly be placed in position upon their mine. There is no larger engine in the Territory.

REESE RIVER.

We clip the following items from the Reese River *Reveille*:—

The White & Hixon claim, on Lander Hill, is now worked at a depth of about 100 feet, where the ledge is found to be well defined. Ore has recently been taken out remarkably rich in ruby and wire silver—so rich that it is supposed it will yield upwards of a thousand dollars to the ton. The claim embraces only 600 feet, and is entirely owned by four persons, one of whom is Mr. Austin, Superintendent of the Pacific Foundry of San Francisco, who has a sample of the rock, which is really well worth seeing.

All the roasting furnaces at the Oregon mill are now running steadily, and are turning out a large amount of very fine crude bullion.

The Whitlach Company shipped on the 17th instant $2,200 and had $5,000 ready for shipment. This company now employ 35 men and furnish almost exclusively several mills with rock. The mills principally employed are the Eureka of Big creek, the Pioneer and Farris. Mrs Bartholomew, the Superintendent, has recently visited San Francisco, perfecting arrangements to advance the working of the mine.

An experimental lot of rock from the Buel North Star mine was worked at the Oregon mill, with very promising results. One thousand eight hundred and fifty pounds were worked, which produced $762.48. The silver was run into a very beautiful bar, 990 fine, and will be sent to New York as a specimen of Reese river production. Accompanying the bar will go the following certificate: "Thereby certify that the above amount ($762.48) was extracted from $1,850 pounds of rock from the North Star mine, and worked by the Oregon M. and M. Co., under my supervision.

"J. Q. C. Vanden Bush."

Caude Bullion.—No less than 4,285 ounces of this raw material was received for assay by three offices in Austin, in one day, last week.

The days continue warm at Austin, although the nights are cold, and ice and frost are plentiful o'mornings.

HUMBOLDT.

We compile the following items from the Humboldt *Register* of the 15th instant:—

The Nevada Company sold the stock of delinquent owners on Thursday. All went even for assessments. This company is working very perseveringly to develop the Peru ledge. The original company has a much more favorable location for working, but is managed, apparently, with a view to "freeze out" the bulk of the owners.

We are told that two mills have reached the river, on their way to their respective destinations in this county. One is the mill we mentioned last week as having been shipped for Echo Canon. The other, we understand, is to be put up somewhere on the other side of the river.

Blake & Co. turned out a brick this week, from Gem bullion, weighing 380 ounces and worth $474.22; almost a dollar and a quarter to the ounce.

The Evening Star in Trinity District, has struck another lode of fine ore—as rich as the old vein from which the men continue taking ore by the ton. The mill is all ready now, except that some stamp heads have failed to arrive from San Francisco.

Some patient fellow, the other day, put 140 pounds of quartz through a hand mortar, and smashed out about nine ounces of gold—worth something over a hundred dollars. The quartz, we are told, was from the Monroe ledge, in Sierra District.

Five thousand sacks for the Humboldt Salt Company were landed in town a few evenings since.

The Ætna mine, Prince Royal District, is turning out some very fine ore.

ESMERALDA.

The Esmeralda *Union* gives the following particulars with reference to operations in the Gov. Stanford Tunnel:—The manner in which this valuable tunnel enterprise is conducted reflects great credit upon the skillful and enterprising superintendent, Mr. A. W. Hale. The tunnel is now in a distance of just 355 feet, and is steadily progressing. We doubt if any other tunnel in Nevada is conducted on a more economical principle or in a more scientific manner. The track from the dump pile to the end of the tunnel is as straight as a sunbeam, perfectly solid, and is so well constructed that a small boy can run a car load of rock from the end of the tunnel to the dump pile with ease. We had the pleasure of examining the works in the tunnel this morning. Getting into the car with Mr. Hale, a run of about 15 feet and a shove from his assistant sent us a distance of 300 feet, at which distance is situated his important and ingeniously arranged air-pump. [Described in another portion of this paper.—Eds. Parss.] The tunnel, we perceived, had lately run through a large strata of partially decomposed quartz. The indications at the end lead to the belief that a lead is not far distant, although, possibly, there is not one within fifty feet of the present terminus. Be this as it may, the Stanford is in a fine location, and not many months will elapse before it shall have pierced, at a great depth, many of the leads whose rich croppings, having by aqueous and other agencies been removed from their native places, cover Silver Hill from top to bottom. It will strike the Winnemucca lead at a depth of 550 feet. When we manifested a desire to return to the mouth of the tunnel, we were invited to take a seat in the car, on doing which, with Mr. Hale, a short run and push sent us with pleasant speed to the dump-pile, about 400 feet.

A gentleman from Bodie informs the *Union*, that arrangements are being made by a New York company to erect two large quartz mills at that place. They are much needed in that rich district.

Boiled Rice.—To many, a good dish of plain boiled rice will appear to be attainable by a knowledge of the simplest rules of the culinary art; but this is a great mistake. Unlike wheat, rice has no gluten, and it cannot, therefore, be made into bread; but it can be, and generally is, made into a soft paste, repulsive to the taste and oppressive to the stomach. When well cooked, each grain of rice should be whole and distinct, but swelled to its full size and easily masticated. There are but few cooks in this section of country who can prepare such a dish, and none of the cook-books we have ever seen will furnish the proper information. The first thing to do is to scald the grain. This must be done before it is washed in cold water. Take the rice and sprinkle it with fine salt, and pour over it boiling water sufficient to immerse it. Let it stand until it can be handled, and then rub it hard, to cleanse it from the scurf and dust. Afterward, rinse it in three or four successive waters, rubbing it vigorously each time; then drop it into boiling water, adding a little more salt, if necessary, and let it boil about twenty minutes. Chinese table-rice may boil a few minutes longer. Take it up in a cullender or tin basin with perforated bottom, which will drain off the water, and set it on the hot range or cooking-stove for a few minutes, to dry out the surplus moisture. It needs no further seasoning; and its beautiful appearance, as it is dished for the table, will justify the process of cooking which we have described.

Toland Medical College.—Dr. Toland, the founder, and first President, delivered the opening lecture of this institution on Monday. It starts under very favorable auspices. The number of students entered, and about to enter is thirty. The building, though still incomplete, presents a beautiful appearance.

New York Correspondence.

TITLES IN AMERICA.

Just now the Ladies appear to be "running to titles" in New York. Their use of titles is often ridiculous. What can be more absurd than to confer upon married women the official titles of their husbands? Why are ladies so estimable as Mrs. McClellan and Mrs. Grant called Mrs. General McClellan and Mrs. General Grant? They are no more entitled to the title of general than Mrs. Lincoln is to that of president or than Mrs. Bates—if there be a Mrs. Bates—to that of attorney-general. How childish it would sound to speak of Mrs. Mastermate Mizzen, or Mrs. Surgeon Scalpel, or Mrs. Sergeant Drill! Yet the titles mentioned are just as applicable to women as that of general. Ere long, perhaps, we shall hear of Mrs. Bessie Boatswain, and Miss Carrie Coxswain; and black-eyed Susan will figure as as Mrs. Foretopman. Titles have a sort of *salique* state here, not going to women. If it were not so, what bevies of honorables we should have in crinolines, what fair mobs of esquires, and what crowds of feminine LL.D.'s and D.D.'s, and, perhaps, of Reverends! Women rule by right divine—a gynæcracy of goddesses—but they rule without titles that are expressed."

LITERARY CHIT-CHAT—THE COPYRIGHT OF IRVING'S EARLIER WORKS.

A sensation of no common order is impending over the book trade, I suppose I violate no confidence in ventiluting in advance what little I know about the coming event whose shadow is already cast before it. An enterprising, and progressive bookseller—who, in this particular instance happens to be wiser than most of the other wise men of Gotham—has discovered that the copyright privileges and immunities of Irving's *Sketch-Book*, *Knickerbocker*, *Bracebridge Hall*, *Conquest of Granada* and *Tales of a Traveller*, have expired by lapse of time, and that, therefore, the monopoly in that particular portion of the Irving literature has come to an end. The facts are these: *Knickerbocker's History of New York* was first published in 1809, the *Sketch-Book* in 1819, *Bracebridge Hall* in 1822, *Tales of a Traveler* in 1824, *Granada* in 1829, *The Alhambra* in 1832. The United States Copyright Law of 1831 gives to an author the exclusive right of publishing for twenty-eight years, and a right of renewal to himself, *wife or children*, for fourteen years more, making forty-two years in all. Under this law it will be seen that four of the books named are really outside the pale of our Copyright law; the other two are, perhaps, open to question on that point. The publisher to whom reference has been made purposes to reprint the original edition of these works (one or two of them being dedicated to Sir Walter Scott) from the copies bearing Lea & Blanchard's imprimateur. It is well known that Irving's contract with this celebrated firm terminated in 1844, and that for five years thereafter, no other publishers dared to undertake a new issue of Irving's works, when George P. Putnam took upon himself the labor *con amore* of introducing anew, and in modern garb, our greatest prose writer to the people of his native land. How well Mr. Putnam has performed his work, let millions of readers attest. It is certainly to be hoped that the somewhat adventurous privateer who now intends to do a little freebooting with Irving's name on his vessel, will succeed in pleasing the public as perfectly as Mr. Putnam has done. Meanwhile the new 'regular' publishers of the Irving books will need to act with reference to the facts I have stated.

The celebrated Mudie's Library of London, has passed out of its originators' hands, and has became the property of a joint stock company, formed of the principal London publishers—led by the famous Murray. Mudie continues as managing director, at a salary of $5,000 a year.

Finger Talking in Factories.—The female operatives in some of the factories in Lowell, being prevented by the noise and clatter of the machinery from indulging in the indespensable amusement of the gentler sex, have restored to a new mode of telegraphing. Fingers have been substituted for tongues, and through the instrumentality of the alphabet of signs, invented for the use of the deaf and dumb, while away their "ten hours" with discussions upon matters and things in general. The new mode has a great advantage over the old, science; the whole party can talk at once without any confusion, a hundred feet being as little interruption to those communications as five. This language of signs is well worth acquiring, as the facilities which it affords are often valuable, especially in the sick room. A distinguished philanthropist of Massachusetts has become so habituated, from the force of circumstances, to the use of this mode of interchanging thought, that its superiority over the oral system is a theme which he never tires of discussing. Upon his showing, the tongue is not only an unruly, but very nearly a useless member.

City Stock Reports---San Francisco Stock and Exchange Board.

From the "Weekly Stock Circular" of the Associated Brokers.

San Francisco, Saturday Morning, Oct. 29th, 1864.

The stock market has exhibited a fair degree of activity during the week, and nearly every share on the list has been well maintained. Receipts of bullion from prominent claims continue unabated, and the average yield for the current month will be fully up to that of any former like period. The present condition of a number of these mines is more flattering than for some time past, and it is believed that larger dividends will soon be disbursed to stockholders out of their net earnings. More economy and better judgment has of late marked the management and general policy of leading companies, and dealers in these stocks now feel that their interests are judiciously protected by honest and capable directors.

A number of shares less prominently known to the market, and of more uncertain value, have attracted some attention recently, and were largely dealt in the past week. It is difficult to ascertain the intrinsic value of these claims, many of which are producing fair pay ore; but operators seem confident of their future, and are willing to invest in them at current quotations.

The money market continues to favor borrowers, and a number of loans have been made upon mining stock collaterals, at the usual bank rates. First-class shares are obtaining more favor with capitalists, many of whom discriminate with less severity than formerly the securities offered them.

Legal Tender notes are somewhat inactive, and dull at 49@49½c.

Savage has met with trifling sales, but is firmly held, at rates advancing from $1,800 to $1,900, and closing at $1,950 asked. Receipts of bullion from this mine for the current month will exceed $200,000, and the company have already at their credit in bank a larger sum than will be required to pay their next dividend of $75 per share.

Gould & Curry rose from $1,625 to $1,685, declined to $1,650, and was offered yesterday at $1,650. Small transactions have taken place in this stock. The entire yield of the mine for the month of October will amount to some $230,000, and the regular dividend of $50 per foot will be disbursed to stockholders. We are apprised of no new features in this claim, but late developments are regarded with much favor, and would seem to warrant present quotations.

Chollar has been dealt in to the extent of 39 feet, rising from $1,000 to $1,050, receding to $990, and closing yesterday at $1,030 bid, $1,050 asked. Indications are said to be good in the fifth level of the north mine, and the southwest drift continues to disclose a larger and more valuable body of ore. Preparations have been made to hoist 125 to 150 tons daily, and the yield of bullion is likely to be materially increased.

Potosi is dull, but strongly held. Small sales were made at $850.

Yellow Jacket has been in more request, and 35 feet were sold, declining from $800 to $790, advancing to $875, buyer 30, and closing at $855@860. Reliable Washoe advices speak favorably of this claim.

Hale & Norcross was in decided favor early in the week, and quickly rose from $490 to $600, but receded since to $500, and was sold yesterday at $490. Some 35 feet have changed hands.

Empire Mill & Mining Company was sold at $500 per share. The affairs of this company are now promising. Some 50 tons of ore are being taken daily from the third level at a depth of 450 feet. A dividend of about $25 per share is anticipated for the month of October, and after the payment of this a considerable surplus will be carried to the dividend account for next month.

Ophir rose from $400 to $430, buyer 30, dropped to $400, and closed at $415. Thirty-four feet were dealt in. The company's new mill on the Carson is at present crushing the large amount of low grade ores on hand. The drift from the central shaft is now within 25 feet of the lower gallery in the Ophir mine.

Uncle Sam has declined from $250 to $225, at which rate 19 feet were sold; and Overman also receded from $200 to $150, within which range 41 shares changed hands. We are informed, unofficially, that the stock of the Uncle Sam Company is to be increased to 4,000 shares, 1,600 of which are to accrue to the Overman, 700 to the North American, and 100 shares to other parties, and that this settlement will effectually dispose of all pending litigation.

Imperial fell to $144, the lowest point it has reached for some time, but under the influence of large receipts from the mine has advanced to $153. The yield of bullion for the month will amount to some $70,000, and a dividend of $7.50 will probably be declared.

Burning Moscow still maintains its prominence at the Board and has been largely dealt in. Opening at $69, advancing to $85, receding to $59, rallying to 74, then dropping to $63@57½, seller 45, and selling yesterday afternoon at $62. Within this range 1851 shares were sold. It is stated that at a depth of 140 feet from the surface, and also at a still greater depth of 60 feet, a vein of good pay ore, 7 feet wide, has been developed. A number of mills are to be at once employed. This company are out of debt with money in the treasury.

Sierra Nevada is in more favor, advancing from $42 to $70, receding yesterday to $65. At this range 244 shares were sold. A well defined ledge has been met with and the indications are thought to be favorable.

Bullion has attracted considerable attention and 472 shares have changed hands, advancing from $115 to $161, receding to $125, rallying to $140 and closing at about $130.

Nevada, J. G., is in less request, and has fallen from $41 to $31, seller 30, at which latter rate sales were made yesterday; 184 shares were sold.

Buckeye rose from $6½ to $9 and dropped yesterday to $6 asked; Daney rose from $27½ to $59, but is now lower; Golden Age & Empire advanced to $17½ and sold at the close at $16.

Baltic rose from $28 to 35, declined to $25 and is now offered at $26. North American was sold at $45 and is now inquired for at $50.

Antelope advanced to $75@$80 at which rates 42 shares were sold. This company are now out of debt and own a first class mill capable of crushing 25 tons per day, which cost $150,000. They also have a large quantity of good ore in sight.

Wide West rose to $30 and declined to 27½; Real del Monte was sold at $25 and Lady Bryan at $5½@$6½.

Harmon was dealt at $7½; Sheba at $62@65; Burnside at $2½@$4; Green, (G. H.) at $6 to $8, and Caledonia Tunnel at $3 to $6.

$30,000 San Francisco 7 per cent bonds of 1862 were sold at 71½ "between boards."

The aggregate sales of stocks since Saturday last amount to $391,447.

FRANK LAWTON, Secretary.

Commissions on Mining Shares.

Sale at 1 dollar up to 10 dollars	$0 25 per foot
Sale at 10 dollars up to 25 dollars	50 per foot
Sale at 25 dollars up to 50 dollars	1 00 per foot
Sale at 50 dollars up to 100 dollars	1 50 per foot
Sale at 100 dollars up to 200 dollars	2 50 per foot
Sale at 200 dollars up to 400 dollars	5 00 per foot
Sale at 400 dollars up to 600 dollars	6 00 per foot
Sale at 600 dollars up to 800 dollars	7 50 per foot

From $800 to $3,000 per foot, one per cent. on the amount of purchase or sale.

Anything above $3,000 per foot, three-quarters of one per cent. on the amount of purchase or sale.

J. B. E. CAVALLIER, President.

Prevention of Rust in Iron.

Many a valuable hint is to be obtained from an intelligent practical laboring man, which may lead the philosopher into a train of ideas that may, perhaps, result in discoveries or inventions of great importance. When bricklayers leave off work for a day or two, as from Saturday to Monday, they push their trowel in and out of the moist mortar, so that the bright steel may be smeared all over with a film of it, and find this plan an effectual remedy against rust. In Wren's "Parentalia" there is a passage bearing upon this subject: "In taking out iron cramps and ties from stonework, at least 400 years old, which were so bedded in mortar that all air was perfectly excluded, the iron appeared as fresh as from the forge." Oxygen, which is the main cause of rust, is abundant in the composition of both water and the atmosphere; and that quicklime has an astonishing affinity for it is evinced in the homely practice of preserving polished steel or iron goods, such as fire-irons, fenders, and the fronts of "bright stoves," when not in use, by shaking a little powdered lime on them out of a muslin bag, which is found sufficient to prevent their rusting. Another instance, very different and far more delicate, bearing upon the same principles; the manufacturers of needles, watch-springs, cutlery, etc., generally introduce a small packet of quicklime into the same box or parcel with polished steel goods, as security from rust, before sending it to a distant customer, or stowing it away for future use. These cases are extremely curious, because, as a general rule, bright steel or iron has a most powerful affinity for oxygen; consequently it is very readily acted upon by damp, and is rusted in a short time, either by decomposing the water and obtaining oxygen from that source, or direct from the atmosphere. It is not absolutely essential that the quicklime should be in actual contact with the metal, but if somewhere near, as in the case of the parcel of lime packed up with the needles or watch-springs, the bright metal will remain a long while without the least alteration in its appearance; the lime (which is already an oxyd of calcium) either receiving an additional dose of oxygen or being converted into a carbonate of lime.—*Builder.*

The Moon and the Weather.—Mr. Merriam, lately deceased, who probably watched the weather, and made more close observations with instruments, for over thirty years, than any man living, declares that in all his experience he has never been able to perceive that the moon has the least influence over the weather. And yet, to what multitudes is this rank heresy. How they run to the almanacs to see when the moon is "new," when it "quarters," and when it is "full," and predict changes in the weather at these points. The fact is, the moon is new, or quarters, or is full once a week the year round; and in our variable climate, the weather changes often—about once a week—when it does not remain unaltered for weeks; and so, if a change in the weather takes place anywhere near the change in the moon, she is the author of the change. I have known educated men cling to this notion instilled into their children. I have known men who are careful not to plant—especially beans—in the old of the moon. And I put it to my reader, who, as I have no doubt, is wise and well educated, and free from all superstition, had you not a "leetle" rather see the new moon over the right shoulder than over the left? Don't you always think of it when you see the new moon? Can you tell why? It is one of those old roots which time and Christianity have not yet removed. So many had rather see a crow fly over the right shoulder than the left—a remnant of the old Roman notion of omens. The number and variety of superstitions which still linger and burrow in the world, like the remnant of the old Canaanites whom Israel "could not drive out," is far larger than most suppose. My wonder is, not that there are so many roots of the old tree remaining, but that Christianity has done so much towards removing it.—*Dr. Todd.*

Explosion of Gun-cotton.—Dr. Phipson has addressed the following note to the *Mining Journal*:—"I see in the newspapers that a terrible explosion of gun-cotton, accompanied by loss of life, has lately occurred in the works of Messrs. Printers & Co. It is supposed to have been caused by a spark from some steel machinery. Photographers will remember that a year or so ago the photographic chemist Dornbach lost his life by the explosion of gun-cotton, while packing this substance into a cask by means of a wooden pole. Since this occurrence I have already twice stated that the explosion which killed M. Leon Dornbach was evidently caused by an electric spark. Persons who handle gun-cotton are apt to forget (or, perhaps, are not always aware) that it is one of the most electrical substances, and that friction, far too slight to develop heat enough to inflame it, will develop in gun-cotton so considerable an electric tension that electric sparks may be obtained from it."

Impossibility of Perpetual Motion.

"Father, I have invented a perpetual motion," said a little fellow of eight years. "It is thus: I would make a great wheel, and fix it up like a water wheel; at the top I would hang a big weight, and at the bottom I would hang a number of little weights; then the great weight would turn the wheel half round and sink to the bottom, because it is so heavy, and when the little weights reached the top they would sink down, because they are so many, and thus the wheel would turn round forever." The child's fallacy is a type of all the blunders that are made on this subject. Follow a projector in his description, and if it be not perfectly unintelligible, which it often is, it always proves that he expects to find certain of his movements alternately strong and weak, and not according to the laws of nature, but according to the wants of his mechanism.

If man could produce a machine which would generate the power by which it is worked, he would become a creator. All he has ever done—all, we may safely predict, he will ever do—is to mould existing power so as to make it perform his bidding. He can make the waterfall in the brook spin his cotton, or print his book, by means of machinery; but a mill to pump water enough to keep itself at work he cannot make. Absurd as it may seem, the experiment has been tried; but, in truth, no scheme is too absurd for adoption by the seekers after perpetual motion. A machine, then is a mere conductor of power into a useful channel. The wind grinds the corn—the sails, the shafts, and the stones, are only the means by which the power of the wind can be turned to that particular purpose. So it is the heat thrown out by the burning coal which performs all the multifarous operations of the steam engine, the machinery being only the connecting links between the cause and the effect.

Our Country, Past and Present.—An exchange has been taking a retrospective glance at our country's history, and comparing the past with the present. From this we learn that at the time of the adoption of the Constitution the area of the United States was 826,680 square miles. In 1804 we purchased Louisiana from France. That brought us 899,680 square miles more. By the acquisition of Florida from Spain, California, New Mexico and Arizona from Mexico, and Oregon by original exploration and settlement, we obtained 1,215,907 square miles more. The present area of the United States is 2,936,166 square miles, or one thousand eight hundred and seventy-nine millions one hundred and forty-six thousand six hundred and twenty-five acres. Of this nearly a thousand million acres is yet owned by the Government. In 1770 the population of the United States was but 3,929,000. In 1860 it was 31,445,080. The ratio of increase has been 34 per cent every ten years. At the same rate of increase, by the year 1870 we shall have a population of seventy five millions. The total of foreign emigration since the year 1790 was five millions and a half. And more than half of these came from Great Britain and Ireland. Germany sent a million and a half, and France over two hundred thousand. No other country of ancient or modern times can parallel this exhibit either in the expansion of area or population.

Railroads in the West.—During the past ten years there have been built at the West 3,656 miles of railroad, at a cost of $253,280,464, mostly by eastern or imported capital. The Illinois Central Railroad Company alone brought into Illinois $10,000,000, and built a road which enabled the Federal Government to sell $11,000,000 worth of land, and the Company to sell $20,000,000 more to actual settlers, making over 31,000,000 concentrated in that State by the operations of one company. The chief effect of this has been to swell the aggregate grain receipts at Chicago, during the ten years, to 158,543,544 bushels which, at an average price of 66 cents per bushel (the value for 1860 at Chicago), would be worth $120,000,000, thus exceeding by about $31,000,000 the cost of the railroads, through the agency of which the grain was made available. In 1861, the grain increased to 47,697,509 bushels the Southern routes being closed, and in 1862, the amount was 60,150,390 bushels. These figures but indicate the extent of that prosperity which has developed so rapidly during the ten years in the Northern section of the West.—*Lockport Journal.*

Singular Death.—Recently three persons were prospecting for quartz ledges in Montgomery district, near that locality, when one of the party, Lovern, formerly a hotel keeper of Aurora, strayed away. The other gentlemen getting short of water, went in search of him for a drink from his canteen. After a short search they found him, but he had expired from some unknown cause a few moments previous to the arrival of the gentlemen on the spot. No marks of violence were visible on his person, and it is believed he expired in a fit of apoplexy.—*Ex.*

Railway Progress in India.

The annual report on the railways of India, for 1864, shows that 2,687 miles of railway are already completed in that region, and as many more are in process of construction or authorized by Government. The capital already invested and actually expended up to the present time reaches about $256,000,000. The traffic on the roads already completed is rapidly increasing. The receipts for the year ending June 30, 1862, amounted to $5,144,000. Those for the year ending June 30, 1863, reached the sum of $8,560,000. The net earnings of 1862 were $2,170,000, while those of 1863 were $3,900,000. These figures are only the aggregate results of the working of lines, the most of which are incomplete and broken. The recent rapid increase in construction and receipts of the India railroads is owing, in the main, to the extraordinary attention which is now being given to the production of cotton in that region. A late Liverpool paper gives the following particulars in this respect:—

Almost all the railroads now in course of construction in India either are, or, before they are completed, will be connected with the cotton fields of that country. The Bombay, Baroda and Central India Railway runs from the cotton districts of Guzerat to Bombay, and is completed, except one short break, from Ahmedabad to that port. The distance open is 185½ miles, and for the greater part of that distance the railway passes through the great cotton districts of Guzerat, Baroda, Baroche, Surat and Damun.

The Great Indian Peninsular, which is now completed for a distance of 553 miles from the port of Bombay, runs far into the cotton district of Central India, though it has still to be carried a considerable distance before it reaches the great districts of Gomrawuttee and Nagpoor. It is still further from the cotton district of Saugor and Jubbulpoor, although it is intended that it shall ultimately pass through that district, and unite it with the Ganges and with the East Indian Railway at Allahabad.

The southern branch of the Great Indian Peninsular Railway has also been carried into the cotton district of the South Mahratta country, being completed as far as Sholapoor. It is still, however, a great distance from the Dharwar and the Bellery districts, which are amongst the finest cotton districts of India.

The Madras Railway is completed from sea to sea—that is, from Madras to Beypore. It passes through the middle of the fine cotton-growing district of Coimbatoor, and will have a great effect in stimulating the production of every part of the Mysore district, which is said to be one of the finest in India.

There is not at present any railway through the cotton district of Tinnevelly, at the southern extremity of India, but it is so near to the sea that a line of moderate length would supply all its wants.

The most extensive line of railway at present completed in India is the East India line. It is open for a length of upwards of eleven hundred miles, with only one break, caused by the bridge at the river Juma, a work of great magnitude, which will probably not be finished before the end of next year.

The railroad over the great mountain pass of the Bhore Ghat was opened in April, 1863, and it is expected that the works across the Thull Ghat will be completed by October in the present year.

Smoke and Smokers Diminishing.—The heavy tax imposed on tobacco has seriously interfered with the trade in that article. In New York the number of cigars manufactured daily before the tax was imposed was over a million. Some two thousand journeymen are out of employment, and they will have probably to follow other pursuits. The most remarkable result of the tax is that it has led nearly one half the smokers to abandon the use of cigars, it is estimated that there are five hundred thousand of the former consumers of the "weed" abstaining from it. This fact is solved by the proportionate decreases in the manufacture of cigars.

New Copper Coin.—The new two cent piece is very little larger and thicker than the present one-cent coin; it contains less nickel, and an abundance of copper, with five parts of tin. In size it may be compared to the silver quarter-dollar, and much resembles a gold coin, and is really beautiful. On one side is a wreath of wheat around the exterior of which are the words, "United States of America," and within it "2 Cents." On the other side there is a shield of Liberty, surmounted by a scroll bearing the words, "In God we trust."

Miss. Lora Clark, of Sacramento, received the premium for the best lady rider, at the recent State Fair, in that city.

The "Unwritten Rules" of the Patent Office.

It has been the practice of the Patent Office, for several years past, to issue circulars to inventors, patentees, and others calling for them, which circulars contain forms for presenting applications, and a brief synopsis of the general rules to be observed in transacting business with the Patent Office. The object is very commendable in the intention, but in many respects proves unfortunate. The mere fact of such a publication emanating from the Patent Office leads many inventors very naturally to the conclusion that, armed with the "rules and regulations," they can proceed to the prosecution of their own business without further instruction. As the result, in almost every instance, proves, the inventor is met at the threshold with trouble, disappointment, and mortification; and, finally, after crowding the files of the Patent Office with correspondence and amendments, he proceeds to Washington, and is there referred to a counselor for advice. It is not the intention and it is impossible for the Patent Office to give all the instructions—general and particular—which is necessary for a person to *competently* transact business before it. There is hardly a week passes in which some questions of practice do not arise in the Patent Office, which are settled solely according to the memories of the older examiners; and hence we have in this department a code *unwritten rules*, which relate to precedents established in the decisions of the several examiners, and which are not put down in the "rules and regulations." It is far from our intention to cry down these official pamphlets, for they are very valuable to counselors, so far as the successive changes in the rules adopted, by different Commissioners are concerned; but as a legal guide, giving *all* the necessary instructions, and to inventors doing business with the Patent Office, they are not sufficient, as such knowledge can only be acquired by a legal and scientific education and long years of close application.—*American Artisan.*

The Eye of the Needle.—A recent traveler to the Holy Land informs us that there is at the side of the principal gate of Jerusalem a small one, which, upon occasions of great urgency, was opened for admission of persons after the great gates of the city were closed for the night. This gate from its small size, was called the Eye of the Needle; and to get a *camel* through it at all was no small task—for a loaded camel to pass was an utter impossibility. With the above fact before the mind, one can see that the words of our Saviour, when speaking of the "strait gate" and the "rich man," were more literal than many suppose. And we see how, as the rich man passes into the narrow way, the sides and the low top of the strait gate scrape everything from him in which he had before trusted. No one can take anything but himself through. Far easier is it to strip a camel of its burden than to divest a rich man of his trust in riches.—*Christian Register.*

Manners.—I make it a point of morality never to find fault with another for his manners. They may be awkward or graceful, blunt or polite, polished or rustic. I care not what they are, if the man means well and acts from honest intentions, without eccentricity or affectation. All men have not the advantages of "good society," as it is called, to school themselves in all its fantastic rules and ceremonies, and if there is any standard of manners, it is one founded in reason and good sense, and not upon these artificial regulations. Manners, like conversation, should be extemporaneous, and not studied. I always suspect a man who meets me with the same perpetual smile on his face, the same congeeing of the body, and the same premeditated shake of the hand. Give me the hearty—it may be rough—grip of the hand—the careless nod of recognition, and, when occasion requires, the homely but welcome salutation, "How are you, my old friend?"

A Funny Frenchman.—A Frenchman in London recently conceived an entirely new style of self destruction. He first bought an egg in the market, extracted its contents (by "suction") and filled the shell with gunpowder. Then going into a very crowded thoroughfare he placed the egg in his mouth and touched it off with a match. Instead however of blowing his head to atoms, the powder, when ignited, merely poured forth a stream of fire and smoke from the aperture in the shell, but without doing any harm to the man. The astonishment of the passers by at beholding a human mouth suddenly become the crater of an active volcano, may be imagined.

Salted to Death.—A few days ago says the Napa *Reporter*, a drove of sheep were driven from poor, dry pasturage into a field of A. Y. Easterby's, near Suscol. It is partly tule and the sheep ate ravenously of the salt feed, and being unable to get to fresh water, out of the lot 75 died. They were the property of Nathan Coombs.

Mining and Scientific Press.

It is Impossible for editors to know all the merits and demerits of their correspondence, consequently the reader must not receive the opinions of our contributors as our own. Intelligent discussion is invited upon all sides and the evidence of any error which may appear will be received in friendship and treated with respect.

American and Foreign Patents.—Letters Patent for inventions secured in the United States and foreign countries through the Mining and Scientific Press Patent Agency. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we shall furnish the names of numerous parties for whom we have obtained patents during the past year.

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the Mining and Scientific Press, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

San Francisco:
Saturday Morning, Oct. 29, 1864.

THE NEW TRANS-ATLANTIC TELEGRAPH CABLE.

We were much interested on Thursday last by an examination of specimens of the cable selected for the laying of the great submarine telegraph, which, undoubtedly, will shortly place America in instant communication with European nations. These samples are at the office of A. S. Hallidie & Co's Wire Rope Manufactory, 412 Clay street, and consists of two specimens alike in proportion but varying in size. The smallest being designed for the first section of 1260 miles nearest the coast, and the largest for the second section of 2000 miles in the deeper portions of the line. They consist of an apparently pure copper wire, about one-eighth inch in diameter, around which are closely twisted twenty-two strands of steel wire, the size of which may be judged from the number used in forming one-eighth of an inch circle. These strands are enveloped in four layers of compound of getta percha or some insulating compound similar in appearance. These form a diameter of one-half inch. This is further wound with a couple of layers resembling tarred webbing, increasing the diameter of the cable to eleven-sixteenths of an inch. We believe there is still to be another skin, or coating, to be applied as the cable is payed out in laying. The smaller sample has a total diameter of one-half inch only.

The Cable is termed "Allan's Indestructible Deep Sea Cable." In the hands it appears remarkably light, not heavier than a good solid flax cord. The largest size mentioned is credited with conducting power equal to 400 lbs copper; weight per mile, ten cwt.; specific gravity 1.6; breaking weight, 7,500 fathoms. The lesser specimen possesses a conducting power of 260 lbs copper; weight per knot, 8 cwt.; specific gravity and breaking weight estimated same as the first. Depth of both, 2,500 fathoms.

These samples were received by Mr. Hallidie from his brother, by the last express from the East, and are the only specimens which have yet been furnished by the manufacturers, Messrs. Glass, Elliott & Co., of London. The Gutta Percha Company and Glass, Elliott & Co., recently consolidated under the name of "Telegraph Construction and Maintenance Co.;" limited capital £1,000,000. In three days £3,000,000 of capital stock was applied for. The company having taken the Great Eastern for the purpose of laying the cable, she will be detained at Sheerness and take the cable down in lengths from East Greenwich. We regret not having the manufacturers' technical description of this interesting article at hand. Mr. Hallidie has also samples of variously wrought cables, composed of strands of steel and iron wire, some of which are nearly one-half inch in diameter, forming a line for defying strong currents, approximating the size of a man's wrist, strong enough to wrest a good size ship's anchor from its cable, should it attempt any interference with such an intelligence-bearing monster of the deep.

HOME FINANCES.

The money market presents no new feature, if we may except an increasing supply of capital for loan purposes. The older banks still adhere to former rates—1¼ per cent per month—in affording facilities to their regular customers, but accomodations can be obtained at lower rates; and we are apprised of some important transactions at 1½ per cent per month. The foreign banks recently established here are anxious to extend their sphere of operations, and seem determined to compete sharply for business. In the purchase of bullion, for English & Oriental markets, they have certain advantages that our local institutions do not possess; and also in the sale of exchange, they can afford to offer greater inducements to purchasers. The government tax of one fifth of one per cent required upon all bills of exchange, telegraphic transfers, &c., they avoid the payment of, by using the drafts of their agents and principals in British Colombia. This is a desirable arrangement to them, and must have the effect to divert business into new channels. To show the growing importance of the oriental bullion trade, we may remark that nearly one half million dollars in treasure were shipped Thursday, in Koopmanschap & Co's line to China.

The receipts of treasure from the north coast, and mining districts in the interior of this State, and Nevada, amount to $1,000,000 since Saturday last.

The bullion market is quite firm owing to the demand from shippers and the light receipts from the country. Gold bars are commanding about eight hundred and sixty, and as high as eight hundred and seventy has been paid for selected lots. Silver is also in request and may be quoted at from one per cent discount to two and one half per cent premium.

Legal Tender notes are in good supply, but without especial inquiry, at 49@49½. The fluctuations in the gold market at the East unsettles the market here for greenbacks.

The American Artisan and Patent Record.—We have received the first nineteen numbers of this journal, and from a careful perusal of its columns are candid in saying that it is the most valuable exchange upon our list. Its patent office reports are complete, and its leading articles are possessed of an unusual degree of originality and useful character. Messrs. Brown, Coombs & Co., are its publishers, and we wish them success in their important undertaking.

Coming Up.—By reference to our advertising columns it will be seen that our old friend, T. C. Sanborn, long and favorably known in this city as a Stock Broker, has again girded up his loins and entered the ring for a wrestle with Fortune, the fickle goddess. The storms of adversity broke not his spirit, and we hope they may not again upon him *Hail, Nor-cross* his pathway with aught else than sunshine.

Odd Fellows' Journal.—W. W. Broughton, of Santa Cruz, is about to commence the publication of a weekly paper in San Francisco, in favor of the universal brotherhood of the I. O. of O. F. The Santa Cruz *Sentinel* recommends Mr. Broughton as a young man of character, ability and energy.

Rich Copper Ore.—We have received some rich specimens of copper ore from unknown parties. Further description of the rock will be given when we receive the address of the donor. Freight charges one dollar. We shall not hereafter receive or take notice of any unpaid packages sent to our address.

More Machinery for Washoe.—Several of Farrand's Premium (Oscillating) Amalgamators, of large size, were shipped for mills in Washoe last week. Mr Farrand has also left for the Territory to superintend their introduction and first operations.

A Nugget worth $400 was taken from the claims of the Branch Mining company, at Minnesota, Sierra county, on Tuesday, of last week says the *Messenger*.

ABOUT THE OWYHEE COUNTRY.

Mr. W. M Gabb, of the State Geological Survey, has just returned to this city, having spent the summer with the Owyhee Expedition. The party left Fort Klamath about the first of July, crossing southern Oregon and going as far east as the Owyhee or Jordan Creek mines. The country traveled over was mostly desert, interspersed by a few valleys not remarkable for either size or fertility. Of these, the recently famous Surprise Valley is a fair example; a long narrow valley, the greatest depressions of which are filled with intensely alkaline water, a narrow strip on the west side barely habitable, and the rest and by far the largest portion, sage and sand. In the valley are two log houses, the only ones between Fort Klamath and the Owyhee mines. About forty men were said to be living in the valley, when the expedition passed through. The Pueblo mines, lying in Nevada, nearly North of Lassen's Meadows and about 30 miles south of the boundary line, were visited. These mines may probably become valuable in the future for copper. The ore is *Erubescite* and very rich; but the amount of silver and gold is so small that they are practically valueless for the present.

The Owyhee mining region lies in the south west corner of Idaho Territory, in the Owyhee mountains on Jordan Creek, a tributary of the Owyhee River. Here, the veins are in granite, are numerous and well defined though small, rarely over four or five feet thick. The ores are gold quartz and black sulphurets of silver. Four mills have been erected at a considerable expense, but they are all fitted for gold quartz; no preparations having been made for reducing the sulphurets of silver. A considerable amount of money has already been expended in developing some of the claims and a few of them give sufficient promise to warrant further work. In addition to these, there are of course an abundance of "wild cat" claims. Most of the interests in this region are owned either by persons on the spot or in Portland. About 260 veins have been registered by name, among which may be found the Morning Star, Allison, Oro Fino, Lady Candis, War Eagle, Potosi, Whisky, Greed Yankee, Abe Lincoln, Jeff Davis, Manatacette, Home Ticket, Home Stretch, None Such, Rough and Ready, and a hundred other names as fanciful and appropriate. The expedition returned by nearly the same route as it took in going out, except that two "cut-offs" were made, by which Pueblo and Surprise Valley were both avoided and the distance shortened over a hundred miles. The route will undoubtedly be used hereafter, since goods can be taken from San Francisco, via. Crescent City and Jacksonville to the Owyhee and perhaps even to Boise more cheaply and expeditiously than by the round-about route through Portland and Umatilla.

Cinnabar Discovery.—The Humboldt *Times* is informed that a valuable lode of cinnabar has recently been discovered in Klamath county, opposite the mouth of Blue creek, and that nine claims, of 600 feet each, have been located thereon and recorded at Orleans Bar. A test of the ore has resulted so satisfactorily that the discoverers are making preparations to develop it immediately.

Iron Ore.—About seventeen miles from Portland, Oregon, is an iron ore of the variety known as "limonite," said to be suitable for making pig and bar iron, and which produces about sixty per cent. of pure iron. Specimens were exhibited at the late Mechanics' Fair, and others may be seen at the Occidental Hotel. This will doubtless form a valuable deposit at no distant day.

A bar of gold, valued at $10,618.25, is the result of one week's run of the Crescent City Quartz Mill, in Indian Valley, Plumas county. This, it will be recollected, is a regular dividend-paying company. Their last dividend was $50 per share, payable on the 1st of the present month. This company is worthy of a more general notice than it receives, as a productive California mine.

Home-Made Air Pump for Miners.

The Esmeralda *Union* gives the following notice of the operation of an apparently well devised construction for exhausting smoke and foul air from tunnels. We would feel obliged to the inventor, Mr. Hale, if he would furnish us a definite description of the article by which other miners might be able to work.

In the Governor Stanford Tunnel, situated in a chamber made for the purpose, is a very ingenious though simple air-pump, by means of which the foul air in the tunnel is driven out with astonishing rapidity. A large air box is connected with this pump, and at every stroke fifty cubic feet of bad air is driven out of the tunnel. The air duct, through which the foul air is forced out of the tunnel, is shaped like a long, square box, and runs along in the middle of the track, serving a walk for the men. This elongated box is made in the most substantial manner, and is perfectly air-tight. On letting off a blast, instead of waiting an hour or more outside for the smoke to pass out, the men go to the pump, and as the smoke and foul air is driven out in the manner above described, fresh air rushes in. It takes but five minutes to rid the tunnel of smoke and foul air. The simplicity and effectiveness of this valuable contrivance, for which the company is indebted to the superior mechanical skill and inventive powers of Mr. Hale, commend themselves at once to the admiration of the economical miner. The invention sets aside the necessity of expensive air shafts, and creates a new era in tunneling. While in the tunnel the pump was set in motion, and as we placed a candle near the end of the box it went out in an instant, so great was the "suckage." We would advise the miners of the district, especially those engaged in tunneling, to call and examine the invention of Mr. Hale, some time when their presence will not interfere with the miners at work. We presume Mr. Hale would have no objection, at any suitable time, to showing those directly interested, the advantages of his invention.

A terrific thunder-storm prevailed yesterday morning for several hours. The rain fell in torrents, and caused another caving in of the culvert at Reed and Third streets. The lightning was so intensely vivid as to make the gas lights in the streets look like so many dark spots. In the southern section of the city the streets appeared to be filled with balls of fire; the streaks of electricity could be heard on some occasions hissing through the streets. The lightning was incessant, and the thunder shook the earth. During the storm the steeple on the Rev. Mr. Chandler's church, in the northern part of the city, was struck and considerably damaged. The subtle fluid escaped out of the lower story of the steeple, and then, as it seems, passed to the ground without doing further harm. A house located on Athertoe street was struck during the elemental war, but was not much damaged. The severity of the storm was the subject of general conversation yesterday.—*Philadelphia Press, Sept. 12th.*

On The Home Stretch.—The Reese River *Reveille* says: From different sources we learn that the stampede from Idaho has been as great this fall as the immigration to it was in the early part of the summer. John Hill and George Priest, of this city, who went there last spring, returned yesterday, direct from Virginia. Dr. Henry Sill, of Dayton, in this Territory, also came with them. They say that there is one gulch there that is equal if not superior to the best diggings ever discovered in California. The great trouble was there were to many people there, or the diggings were not extensive enough. Thousands were retracing their steps to the States, others going to Oregon, Washington Territory and Salt Lake; in fact any where they could so as to leave Idaho. Nearly all the early located claims of course were doing well, but unless new discoveries are soon made the country will be deg and "played out."

A Wealthy Community.—According to the report of the returns handed to the City Tax Collector of San Francisco, on Monday last, by which he is empowered to collect the taxes, it appears that the total value of real estate in the county subject to taxation amounts to $47,292,903. The value of personal property assessed amounts to $33,433,261, making a total of $80,736,164. There is not a community on the face of the earth, of the same age, that can furnish similar figures of its wealth.

The largest pear, which has been produced in California, the present year, so far as we have learned, weighed three and a quarter pounds. It was brought up from Los Angeles on the *Senator* on her last trip, by Wells, Fargo & Co.'s express agent, and was sent East on the steamer of Saturday last. The drought of the past season has been a great drawback to the production of fruit in this State.

Continued from page 273.

We look upon it as a great improvement on the old style of rope-making machine, and are satisfied that with the same amount of power double the amount of work can be done in a much better manner, while almost any velocity can be attained in this machine with perfect safety, as nothing revolves but the light frame, and this is secured inside a circular disc, between which are pinced anti friction pulleys.

For laying the wire armor of submarine cable it is admirably adapted, the gutta percha core containing the copper conductor being so payed into the center of the surrounding wires as to be free from danger of contact, etc. It fully deserves a Premium.

E. T. Steen, San Francisco.—Reynold's Cut-off for steam engines. Is an Eastern invention; has been in use for a number of years in this State; is a good regulator, and has advantages as a cut-off.

P. Lamb, San Francisco.—Damp Regulator for steam boiler furnaces. Is a very ingenious invention to regulate the draft in the furnace of the boiler. It will save fuel and equalize the steam. Premium.

George Bowers, San Francisco.—Wilson's Tire Upsetter. Works very well.

R. L. Harris, San Francisco.—One model Improved Railway "Turnout," Mass. Is very good, and universally used in San Francisco.

N. B.—This committee recommend the award of a premium to S. Hill, agent, for Florence Sewing Machine, but the Executive Board, under the rule confining the distribution of premiums to home competitors, cannot approve the award, which otherwise would be due.

Class IV.

Hydraulic, Hydrostatic and Pneumatic Engines and Machines, Turbines, Fire Engines, Pumps, Windmills, Etc.

COMMITTEE:

P. Murray, P. Huerne, T. J. Hughes,
Joseph Moore, A. C. Austin, W. T. Garratt.

Report.

Your Committee upon this class would most respectfully submit, that they have attended to the duty assigned to them in examining the different articles entered under Class IV., and offer the following report:—

Hansbrow & Reddiug—Have on exhibition a hydrostatic or water pressure engine, of about 14-horse power. It has a cylinder 7 inches in diameter, with 14-inch stroke. With water at an elevation of 200 feet, it consumes one inch of water (miners' measure) for each horse power.

The principal feature in the invention consists in using water as an expansive agent, which is accomplished by a beautiful and simple mechanical device—viz: the application of air-chambers and compensating air-valves at each end of the cylinder, imparting an elasticity to the water by that means, and giving it a similar action to steam in the steam engine. The compressed air also causes the discharge of the water at stated intervals after it has done its work. This arrangement allows a much higher speed of piston than has before been obtained in engines of this kind.

After a thorough investigation of the principles of this engine, we find that as an economizer in the use of water, it surpasses any known water-wheel, either turbine or rotary; and we would recommend it in preference to any other water motor, where clean water at a high elevation can be had. Premium.

Thos. Hansbrow—Has a number of sizes and styles of his celebrated "Challenge Pump," which is so well known that this committee can add nothing to its laurels.

In the same case with the working model of the "Challenge Pump" is the bronze medal premium, awarded to it, over all other competitors, at the great Worlds' Fair, London, 1860. It has also taken the premium at all the fairs held in this State. It has one other merit to us, at least—that it is a California invention.

Mr. Hansbrow has also on exhibition a mining pump, the peculiar construction of which renders it better for the purpose intended than any other pump now in use, and which we would strongly recommend. Premium.

Capt. C. H. Harrison—Has on exhibition several of his Eccentric Pumps, capable of discharging from 100 to 2,500 gallons of water per minute.

The principal advantages are, that it is light and compact, very durable, and not liable to choke or get out of order. It has no valves and no packing. It can be run fast or slow; the faster it is run the more water it will discharge. The durability of this pump has been well tested, and for wrecking, or engineering, or any kind of heavy pumping, is considered superior to any other.

Mr. Harrison also exhibits one of Andrews' Centrifugal Pumps and engine (for wrecking purposes), which, with his other pumps, enables him to discharge a very large quantity of water in a very short time, from ships or places where required. Premium.

David Stoddart—Has on exhibition a steam pump possessing some very novel features, of his own invention. It bears a remote resemblance to the "Worthington," being direct-acting, without crank-shaft or fly-wheel, the valve arrangement being controlled by a tappet arm. It is, however, entirely new in its mode of changing the steam valve, which is accomplished by the simple use of only four internal moving parts, and these seem to be beyond the possibility of derangement, and might endure for an indefinite period, never requiring any adjustment after leaving the manufacturer's hands. The strength, simplicity and excellence of workmanship exhibited in this steam pump were fully tested by your committee, and we take occasion here to express the great satisfaction we found in witnessing its smooth and regular motion, against varying pressures, up to 250 lbs. to the square inch.

We found that it has no "centres," as engineers term it; but so sure is the valve gear in its action, that it can be run as slow as one stroke in five minutes without stopping—in fact, it has no starting gear at all; the only operation required in starting it is simply to open the throttle valve. We are informed that this style of pump has been in constant use during one year past, for draining a mine at Mt. Diablo, forcing to a vertical elevation of 255 feet; and the pump on exhibition is to be applied immediately to the same purpose in another mine.

In conclusion, we may say that this steam pump is, in our estimation, superior to any of the same description that has ever before been in common use. Premium.

Gifford's Injector—Manufactured in Philadelphia, Pa. and exhibited by David Stoddart, agent. The assortment of sizes presented, from No. 2 to No. 8, and also the Injector supplying the working boiler at the Pavilion, illustrate the invention thoroughly. This is comparatively a recent improvement in the means of supplying boilers with water, and is certainly the most original invention connected with steam machinery which has been made public since the days of James Watt. It was produced by M. Henry Giffard, of Paris. It is now extensively used in Europe and America. Wm. Sellers & Co., of Philadelphia, are the sole manufacturers and licensees for the United States.

The samples on exhibition—not got up for show, but furnished from the ordinary stock of the agent—are of superior workmanship and elegant finish.

We have no hesitation in recommending this as a valuable improvement, and destined to be universally employed for its intended purposes.

High Pressure Water Wheel—Entered by Wheeler & McAuley—shows considerable ingenuity in its arrangements. The inventors claim for this a higher percentage of power from the water than can be had from any other wheel known, with the advantage of working any head or quantity of water with the same diameter of wheel—a result not usually obtained. They also claim the balancing of the pressure on the wheel and buckets, or valves, so perfectly, that the friction is reduced to a very small percentage.

If the rubbing surfaces of this wheel do not suffer from the grit or sand in the water, we consider it a very perfect wheel.

High Pressure Water Wheel—Entered by Mr. B. Faucbery, is a very neat, compact, and durable Turbine Wheel, and from the manner of balancing one wheel by the other, and the arrangements for setting up the faces as they wear, it looks as if it might be a serviceable wheel. The inventor does not claim for it as high a percentage as is claimed for some other wheels on exhibition, but claims that, for steady and continued work and ease of management it will, in the long run, give better satisfaction than if it was working closer and more liable to wear. Premium.

Tyler's Water Wheel—Eastern invention, and manufactured by Smith & Hausoom, of the "Golden State Foundry." He claims simplicity of construction; that it is not liable to get out of repair, is adapted for high heads as well as low; cheapness with which it can be set up and put to running; not being liable to obstruction, muddy or dirty water can be used as well as clean. It has been in use in a number of places in the State.

Featheriug Paddle Wheel—Entered by Felix Barbairos, of Benicia—is a new method of adjusting the paddles of a steamboat wheel, whereby the dip of the wheel may be varied to suit the draught of the boat, and also enables the engineer to enter the paddles at any desired angle.

There is considerable room for improvement in the steamboat wheels of the present day, and the featheriag paddle has been tried to overcome some of the difficulties, but we believe it is the first time any plan so simple as this has been tried to alter the dip of the wheel. The gain in speed, by the use of the feathering paddles, has been fully proved; but hitherto, the first cost, and the expensive repairs to follow, has been the great obstacle to their adoption for general use. Premium.

A. W. Stratton exhibits his Hydraulic Press Pumps of three cylinders. This is one that he uses for raising brick buildings. It was attached to a press to show how its enormous power could be applied for pressing hay, tobacco, cotton, or any other use where great power is required.

E. A. Atwood has on exhibition one of his self-regulating Windmills, running one of M. D. Lasswell's pumps. This windmill is claimed to be the most perfect self-regulator yet invented, and is capable of being adjusted to any desired speed. It is very durable, and easily kept in order. It is the only working or full sized mill on exhibition. Premium.

E. Mandeville—California made Blacksmith's Bellows (40-inch). For workmanship this bellows cannot be surpassed by any imported. One of its advantages consists in having the iron pin or bearing go clear through the bellows, thereby avoiding the liability of its getting loose and the bellows leaking, and making it much more durable than the imported ones. Premium.

B. A. Henricksen has on exhibition several of his Patent Ventilator Chimney Tops. These are claimed to be better than any other kind of ventilators or chimney tops now in use. One of them is in use on the smoke stack at the "Fair," and is spoken of in the highest terms by those who are using it, as they say it would be impossible to keep up steam in the boiler without this top on the chimney. It is also used on steamboats and mills in this city, and is in every case highly recommended.

M. D. Lasswell has a cast iron, single acting, double discharge windmill pump, which is very durable, and easily kept in order.

A. J. Smith has one of Hudson's Brass and Copper Pumps. It is similar to the Lasswell pump, and is a very good one for domestic use.

Johnston & Reay have on exhibition several pumps well adapted for domestic use.

Chas. Elliott has a working model Water Engine. This was attached to the water pipes, and run a small amalgamator.

Mrs. Dyer has one of Smith's model Water Wheels, New York make.

A. Lind has a model of a high-pressure Water Wheel.

E. F. Hough (of Martinez) has a model of a self-regulating Windmill.

S. F. Blasdell has on exhibition one of Roper's Caloric Engines. This engine is running a printing press and rotary pump, and at times a quartz mill and a circular saw. We find for simplicity of construction, economy of fuel, regularity of motion and durability, it is well adapted to run all kinds of light machinery, or for pumping.

Mr. Blasdell also has several of Stannard's Rotary Pumps, both hand and steam, which are worthy of notice.

A. H. Titcomb has on exhibition a steam Fire Engine and Hose Carriage, of Button & Blake's make. The first of these is singular in its construction. It is so arranged that while at work at its greatest speed it remains perfectly still—not jumping all over the ground, as some others do. This is produced by being power balanced by the piston in cylinder and piston plunger in the pump traveling toward each other at the same time and from each other in the same way, making the pressure equal at both ends, and steadying the machine.

Mechanics' Fair Reports.

By authority of the Executive Committee for the management of the Fourth Industrial Exhibition of the Mechanics' Institute, we shall continue, under this heading, until completed, the publication of the Reports and Awards of the Examining Committees in the various departments of the Exhibition, as revised by the Managers to accord with the rules governing the distribution of awards. Where the reports have not been made in form prepared for publication, abstracts or digests only will be given.

The Managers desire it stated that, while articles originating and manufactured abroad contributed in a degree to the variety and interest of the exhibition, which in return afforded their merits opportunities of becoming widely known, to the advantage of those showing them, the enterprise was intended to be an exposition of the material and industrial resources of this State, and the adjacent Territories, to which the honorary awards must be limited. Believing, too, that the distribution of premiums of several grades among competitors has a greater tendency to produce jealousy and dissatisfaction than to encourage enterprise and efforts for excellence, the Executive Board has determined to allow no second, third, or other inferior grade of Premiums.

From "Pundit."

Editors Press:—The words "reducing agents" at the close of the sixth paragraph in my communication in last week's Press, should have read "reacting agents."

Of course, great dilution with cold water is sufficient to deposit chloride of silver from a hot saline solution, but its introduction and agency is irreconcilable with the conditions of the suggested boiling paraphernalia.

In stating that no geologist will assign a hot water origin to the saliferous gypsum beds I did not intend to exclude the possible operation of the same agents to which I had just referred—hot springs. The sentence, which would have read more clearly with such a qualifying clause, was aimed at any boiling down of an extended body of saline fluid. Neither is the intention of the preceding sentences to convey the idea that *invisible* beds of rock salt may not exist in the deeper rocky strata of the earth, I have deemed these explanations necessary while correcting the misprint first mentioned, because in attempting to be brief it is apparent that I left the said ideas liable to misconstruction. Pundit.

From the Blue Ledge.—A bar of gold has been received in this city, the past week, from the Blue Ledge, El Dorado, valued at $1,900—the result of a crushing of forty tons of rock—about $48 per ton. This is much above the average yield, as most of the gold was derived from a pocket, the rock from which was thrown into this crushing. We understand the works of the company are now closed, under an attachment for debt.

New York Correspondent.—We have received a very valuable article on "Our Iron-clad Navy," from a new contributor, in N. Y., whom we have no hesitation in assuring our readers will prove a valuable acquisition to our corps of scientific writers.

By a singular coincidence the committee's report credited some fine samples of crystal salt, on exhibition at the Fair, to "W. B. Winegar & Son," instead of A. B. Winegar, who is the only salt dealer in San Francisco of that name.

A new City Library Association has been organized at Carson City, N. T., Rev. Mr. Reilley, librarian.

EASTERN FINANCES AND TRADE.

The arrival of the steamer Golden City, places us in possession of Eastern mail advices to the third inst. At that date money was in good demand owing to a short supply of currency which had been absorbed by the late Government loan. This will, however, soon flow back again into previous channels of circulation. A good deal of money had been sent into the interior to move the crops, but this will also return to the seaboard in the regular course of exchange. The Secretary of the Treasury was not contracting the currency, but on the contrary, it was thought that a further issue of legal tenders would soon be made.

The rapid decline in gold had unsettled the value of all stocks and bonds, as well as the merchandise markets. Trade in some commodities had been paralyzed from this cause, and all dealers were awaiting further developments. Government securities had stood the test of the excitement much better than anything else, and ever in good request at enhanced rates. Sherman's series of brilliant successes, and their bearing on the issue of the impending struggle in Virginia, as well as in finance, trade and the temper and tone of the public seem to be the main topics of discussion in the eastern journals. The excitement of a Presidential election was increasing to the exclusion of all other interests.

Superiority of California Salt.—We have samples of fine table salt in our office, manufactured by Mr. A. B. Winegar, of 322 Front Street, which, for fineness, dryness and purity, we are justified in saying cannot be excelled by that produced in any other portion of the globe. California certainly has a superiority over all other climates for manufacturing salt by solar evaporations, and Mr. Winegar is properly improving his years of California experience in this important branch. To many, the salt trade would seem one of comparatively limited importance, but upon this coast, where immense quantities are consumed in the reduction of mineral ores, it is rapidly assuming prominence among our most excellent articles of natural home products. In many instances the treatment of ores by peculiar processes, requires the very first article of salt to be had in the market, and Mr. Winegar fills large orders with the best of table salt, for this purpose.

Important Discovery of Fossils.—Within the past two months some very interesting Fossils have been discovered embedded in the soil near the newly discovered oil springs a few miles east of San Louis Obispo, Tulare county. These interesting fossils include teeth of the ox, bear, elephant, and several other animals petrified, and impregnated with coal oil, with which the ground is saturated for a considerable distance around. Professor Blake has given this important discovery much attention, and has prepared a discourse on the subject which he intends to read before the California Academy of horticultural sciences at its next meeting—which we shall probably publish in the Scientific Press.

Personal.—Professor Brewer, who has been connected with the State Geological Survey upon this coast for the past four years, will leave for the East, via overland route, early the coming week. The Professor goes East to take a chair made vacant for him in the time honored halls of Yale. While we shall miss his genial smile, we here congratulate the Faculty at Yale upon the acquisition to their number of one who combines with a fund of scientific attainments a congenial spirit. We wish him God speed.

Accountant.—We publish, in to-days, issue the card of Mr. N. Lombard Ingols, whose long experience in the adjustment of complicated, and in the settlement of disputed accounts, and in other duties appertaining to his profession, is a guarantee of satisfaction to those who may require his services. His "accounts," like his countenance, are always full and agreeable.

THE NEW AND CELEBRATED FLORENCE SEWING MACHINE.

The above engraving is a fine illustration of one of the most magnificent and attractive specimens of mechanism at the late Industrial Fair—the Florence Sewing Machine.

A better illustration of the importance and truthful benefits arising from such grand exhibitions as the recent one of the Mechanics' Institute cannot be had than the case of the Florence Sewing Machine. Really one of the best inventions of the last decade, it could not do otherwise than steadily gain advancing favor from the time of its first introduction here, some two years ago; since which period it has acquired a permaneut and invulnerable reputation. But previous to the recent Fair its excellent reputation was more or less limited to those who had been taught its merits by personal observation, or had casually learned its value from the high recommeudations of those who had experienced its superior benefits. It is different now. The reputation of the machine, by being brought forth by its honorable and faithful agent, Mr. Samuel Hill, to compete with numerous and hitherto eager cotemporaries, at the Mechanics' Fair, has become, as it were, public property; and when the truth finally became noised abont that the formerly leading sewing machines had withdrawu their patronage from the exhibition of the Institute, (which always treated them with fairness and liberality,) because a *new* and formidable competitor had taken the field, people began earnestly to examine and inqnire into the peculiar merits of the Florence, and the universal conclusion is that its superior does not exist—that it is worthy of all that is claimed for it—that it justly received the highest award granted by the managers of the exhibition! This Fair has brought out, and will extend throughout the State, the genuine merits of the Florence Sewing Machine, and its benefits are already apparent in the immense sales which have been made since the opening of the exhibition. In these remarks we are but reiterating the expressions of scores of our best citizens, whose names appeared in the advertisement of this machine in a previous issue. We will, therefore, leave this theme of our subject, and to gratify the interest which has been awakened in the minds of many in regard to this important invention, give some information regarding its origin and manufacture.

Of all the monumeuts of American inventive genius, and their name is "Legion," none have effected such important changes in

Industry and Idleness.

Mankind are generally supposed to be divided into two races—those who have too much, and those who have too little to do. But when you look deeper into the matter, those who are the busiest are always found capable of doing a little more, and they are the very persons to go to if you want anything done which may require labor, effort, and self-sacrifice. Adam Clarke says the proverb. "too many irons in the fire," is a falsehood, and that you should keep every one of them hot—tongs, poker, and all. As to those who seem to have but little to do, that little is usually a mighty work to them. There is not, perhaps, a man of whom it may be more truly said that he has his hands full, than one of those envied persons who have nothing to do—one who can live without toil, and who has not character, or virtue enough to engage in the seriousresponsibilities of life. To such a one the merest trifle is a bugbear of vast dimensions—to him a molehill is a mountain. You often see such an imbecile grumbling at the pettiest obstacles; while another is seen toiling with vigor, alacrity, and success. In deciding which of these two men has the hardest lot in life, we should reverse the common opinion, and consider the men of nothing to do as those who are overburthened with care. Dr. Canning wisely said, "Do anything harmless rather than give yourself up to thinking. I can speak on this point from experience," he continues. "At one period of my life I was a dreamer—a castle dreamer. Visions of the past and future took the place of present duty and activity. I spent hours in reverie. I supposed I was seduced by physical debility. I found, too, that the imagination threatened to inflame the passions, and that if I meant to be virtuous I must dismiss my musings. The conflict was a hard one. I resolved, prayed, resisted, sought refuge in occupation, and at length triumphed. I beg you to avail yourself of my experience." After this sound advice, we may give one comparison, which is, the miser procrastinates, and the spendthrift anticipates; the former perpetually experiences want, and the latter absolutely prehases it. The one is ever a day before happiness, and the other a day after it. Idleness is the parent of vice and misery. Never be idle, for you can always find something useful to do; and remember that a small beginning with industry and care, will make an estate; whereas the sluggard, who will not plough by reason of the clod, shall in harvest time have nothing. What if you fail in business? You will have life, health, and hope. Don't sit down and cry about mishaps, for that will never get you out of debt, nor buy your children frocks. Go to work at something; eat sparingly, dress moderately, drink nothing exciting, and, above all, keep a cheerful heart. When you are at the anvil, have patience; but when you are at the hammer, hit well. "The way of the slothfull man is as a hedge of thorns."

GENERAL SCOTT'S MOTHER.—In the opening paragraph of his autobiography, General, Scott pays the following beautiful tribute to his mother: In my sixth year I lost my father, a gallant Lieutenant, captain in the revolutionary army, and a successful farmer. Happily my dear mother was spared to me eleven years longer, and if, in my now protracted career, I have acheived anything worthy of being written, anything that my countrymen are likely to honor in the next century, it is from the lessons of that admirable parent that I derived the inspiration."

THE brother of Beethoven signed his name to distinguish himself from his poorer brother, "——von Beethoven, land owner." The immortal composer retorted by signing his "Ludwig von Becthovon, brain owner."

Chinese Views of Death.

There is nothing in the Chinese character more striking than the philosophic resignation with which they undergo changes, or suffer afflictions. There is so much elasticity in their disposition that the most distressing (to us) changes in their condition produces but little effect. A Coolie can admirably ape the dignity of the mandarin when promoted, and a disgraced official, or ruined merchant, who had formerly lived in luxury, appears little to regret the change he has undergone. There is no fear of death among them, hence they are happy, though they have a character for cowardice. It is true they have the relics of the dead constantly before their eyes. The country is covered with graves, and in many places near and about Shanghai the coffins (which are beautifully made) are openly exposed in the fields. They are provided by every man on the day he becomes a house-keeper, and set up in the house where he worships his ancestors. This usage prevails among all classes, from the highest to the lowest, the Emperor setting the example. When a member of the family dies, the dead body is placed in the coffin, and kept until a propitious day arrives for the burial (which they seek by astrology). Months, in some instances, pass by before the coffin, with its contents, are removed. When the coffin is decayed the bones and ashes are carefully gathered, and, in a country walk, one may often see jars containing "potted ancestors." Money is saved for a second coffin, which, if not immediately expended for the purchase of that essential article, is not applied to any other purpose. The first time we saw a coffin in China was in a cottage near Shanghai. There it stood in the corner, covered with dust and cobwebs. We asked a lad why it was there; he quietly pointed his thumb over his shoulder to his grandmother, who was standing close by, and said it was for her. She was very old, and had nearly worn out her coffin before she was ready to get into it. At funerals females are hired to do the "inconsolable grief," as they were formerly in Ireland. It seems very ridiculous that such a custom should be kept up in a country where the people are so well educated and refined, and when it is known by every one that the mourners "howl for hire." They certainly earn their money, and their piteous moans would be heartrending if they were real.—*Notes of a Traveler.*

Coffee as the French Prepare It.—In Paris, the coffee is nectar compared with the beverage we in common call coffee. I was desirous to know how it was prepared, and soon learned. The French use three kinds of coffee, Mocha, Java, and Rio, mixed in equal parts. The coffee before roasting is winnowed, to cleanse it of dust, etc.; it is then culled or picked over; every black or defective kernel is picked out, as well as small stones, seeds and rat droppings, which are abundant in most coffee. It is then put into clean water and well washed, then spread to dry; when dry it is ready for roasting. The coffee required is roasted daily at large establishments; while warm it is ground, and put up in glazed papers of a conical shape, holding from two ounces to half a pound, and sealed up. Gentlemen, as they leave their places of business for home and dinner, when convenient, call and take the needed supply. The coffee is put into a pot or digestor in cold water, and then set over a lamp expressly for the purpose, and there heated, not boiled but steeped; from this digestor no steam or fumes arise; when ready you have your cup of coffee. It is coffee, and a beverage delicious, health-giving—not the bitter, acrid, filthy, nauseous drug we are in the habit of partaking, and calling it coffee.

According to the London spectator, which devotes an elaborate article to the subject, the available fighting strength of England is small. Nominally, there are 84,000 regular troops, 102,000 militia, and 160,000 volunteers but really not more than 50,000 are available for foreign service, and of these but 20,000 would be troops of the line.

IMPORTANT DISCOVERY
—IN THE—
Photographic Art.
Jacob Shew's
CHROMATIC PROCESS OF PRINTING PHOTOGRAPHS.
[PATENT APPLIED FOR.]
THE UNDERSIGNED WOULD ANNOUNCE TO THE public that he has discovered a new and IMPROVED PROCESS for printing Photographs, which produces a
SOFTNESS, CLEARNESS AND DELICACY OF TONE
unattainable by any other known process and to which he has given the above name. It is applicable to any size of Photograph, and those having valuable old negatives which they desire printed by the improved process can do so at any time.
In order to secure the pecuniary advantages to be derived from this important discovery a patent has been applied for. When obtained, the privileges of the right will be disposed of at a reasonable rate to any Photographer desiring it. In the meantime all are warned against encroachments upon the rights of the discoverer as such will be prosecuted to the full extent of the law.
"Cartes de Visite" and large Photographs printed by this process will be furnished at the prices of the ordinary work of other establishments.
☞ The public are invited to examine specimens at my Gallery. ☜ JACOB SHEW.

To News Agents.—After this date we shall furnish no dealers, outside of this city, with the Press upon any other terms than those of regular subscription. Those who will forward us the names of new subscribers shall receive liberal commissions.

OFFICE REMOVAL.—By reference to the card of W. O. ANDREWS, ESQ., it will be observed that he has removed his notarial office two doors, but still remains in Montgomery Block. Mr. Andrews is one of the most careful and reliable gentlemen with whom we have ever had the pleasure of transacting business.

ABSENT.—Our senior editor is on a visit to his former place of residence, Grass Valley, which will account for any irregularities in this No. of the PRESS. A word from the mines located in that section may be expected next week.

ANOTHER SERIOUS EXPLOSION.—The boiler of the steamer Sophie McLane burst while she was lying at the wharf at Suisun, on Wednesday. Some six or eight employees of the C. S. N. Co., including the captain of the boat, were killed, and others badly injured.

Reports of the Exhibition.—Owing to the omission of exhibitors of certain classes to elect committees of award, the Executive Committee of the Institute, at its meeting of Oct. 27th, authorized the President to select a special committee to act in the premises and report upon articles thus inadvertently omitted from the several reports. The report of this special committee, together with a general report of the Executive Committee, will appear in due time.

And in accordance with law, and an order of the Board of Trustees made on the 17th day of October, 1864, so many shares of each parcel of said stock as may be necessary, will be sold at the office of the Secretary, on the 12th day of November, 1864, at hour of 12 o'clock, M. of said day, to pay said delinquent assessments thereon, together with costs of advertising and expenses of the sale.

A. G. WOOD, Secretary.

Office, 240 Montgomery street, S. E. corner of Pine.

Worth Considering.—Advertising has proved the medium of success to many of the most prominent business men of the world. Merchants, Inventors, Builders, Patentees, Manufacturers, Foundrymen, Machinists, and, in fact, all who wish to call the particular attention of the Mining, Professional, Mechanical and Industrial members of the community to their business, should not fail to advertise in the MINING AND SCIENTIFIC PRESS. The circulation of the paper is extensive, and has a wide range, reaching the most intelligent readers in every mining settlement of importance on the coast. A large number of copies are also sent East. Our terms are reasonable. "Live and help live" we believe to be a sensible motto.

Machinery.

WHEELER'S

Amalgamating & Separating Pans.

IT IS ACKNOWLEDGED BY ALL WHO HAVE EXAMINED the principles and witnessed the operation of these Pans, that they are decidedly superior for triturating and amalgamating purposes to any other in use.

The most important principle connected with the operation of these Pans is the separation of the triturating process from that of extracting the amalgam from the sand.—The chief cause of loss of the precious metal arises from the passing off of the same in combination with the quicksilver, during the process of trituration, and in cleaning up. By the introduction of the Separating Pan to follow the triturating, this loss is entirely avoided. In working these machines there is no appreciable loss of quicksilver, and hence none of the precious metals.

Where these Pans have been introduced and operated by the side of other sands from the same vat, the Wheeler Pans have uniformly gained a large percentage of metals, over its competitors, as well as a still larger percetage in the amount of work performed.

*** These Pans may be seen in daily operation at the Miners' Foundry, on First street, San Francisco, where all interested are invited to call and examine for themselves.

no16-tf ZENAS WHEELER.

Hepburn & Peterson's

AMALGAMATOR.

THE SUBSCRIBERS WOULD CALL THE ATTENTION of the Mining Public to their Reducer and Amalgamator, and also to their Separator for reducing and separating the mineral from

Gold and Silver Ores,

Manufactured and exhibited at the Vulcan Iron Works, Nos. 137 and 139 First street, San Francisco.

These machines secure to the Miner a more Expeditious and Perfect Reduction and Amalgamation, a less liability to accident and delay, and a greater amount of useful effect in proportion to the power employed to keep them in operation than any other machine now in use for producing similar results. This fact is attested to by their general adoption and preference at all the principal Reduction Works in Nevada Territory; among which may be mentioned the Gould & Curry Mill, the Silver State Reduction Works, Zephyr Flat Mill, Pioneer Mill, Eastern Slope Mill, Phœnix Mill, etc.

☞ This Amalgamator may be seen in operation at Kastel Bros.-works, Bryant St. between 3d and 4th.

(Illustrated in the Mining and Scientific Press, April 9th, 864.)

nov8 3m* HEPBURN & PETERSON.

To Quartz Miners.

ALL PERSONS INTERESTED IN MINING MACHINery are invited to call at the Pacific Foundry and examine my improved Amalgamator. It is unquestionably superior to anything now known for amalgamating Silver and Gold. It works 1000 pounds at a time, and will amalgamate over three tons a day. By the motion of the revolving muller, the pulp is drawn through its center and passes under it, between the grinding surfaces, to the circumference; from whence it passes again over the muller to the center, through the holes and between the grinding surface to the circumference as before. Thus a constant circulation of the pulp is kept up, bringing the particles of ore again and again under the muller, and reducing the whole mass to an impalpable powder.

No quicksilver lies between the surfaces to be ground, but at the circumference and center of the pan where the metal must pass through it as the pulp circulates.

A patent was granted for this Amalgamator in December last, and all persons are again warned against purchasing machines made at the 'Miners' Foundry, called "Wheeler's Amalgamator," as they are an infringement on my patent, and a suit is now pending in the U. S. Circuit Court against the parties infringing. My Amalgamator can be seen running at the Pacific Foundry, where all can judge of their operation and the very superior style in which they are being manufactured. THOMAS VARNEY.

sep21

PRATER'S

PATENT CONCENTRATOR.

THE PROPRIETORS OF THIS NEW CONCENTRATOR, having completed arrangements for its manufacture at the Fulton Foundry, in this city, now offer it to the public, with the fullest confidence that for the purpose for which it is designed

It Has No Equal in Use.

The principle of this machine, which is designed for a Concentrator exclusively, is entirely new. It is designed for separating finely divided quicksilver, amalgam and gold from the sands, and for concentrating and saving the sulphurets, and is to be placed behind all or any other machine in use.

This machine is now running on waste sands, from which it is taking out an average of 3½ pounds of quicksilver for each ton of sand. Orders or letters of enquiry may be addressed to

HUNOERFORD & PRATER, Proprietors.

San Francisco, April 1st, 1864. 14v8-tf

Disney's Cylinder Amalgamator.

The Cheapest and Best.

DISNEY'S CYLINDER AMALGAMATOR, WHICH HAS recently been introduced to the public, has already been proved a complete success, and can be furnished, at a price cheaper than any other in use. It is simple in construction, and so arranged as to do a large amount of work with the smallest expenditure of power. The proprietor is satisfied that he can do more work in a given time and with a given expenditure of power than any other amalgamator in use. For small companies who desire cheap yet effective machines, none can be more desirable.

It may be seen in operation at the Rail Road Foundry on Fremont street where

A NEW CRUSHER

Is in operation and he can crush and Amalgamate at the LOWEST RATES. Miners and all others interested are invited to call and examine for themselves.

M. DISNEY, Patentee.

San Francisco, June 23, 1864. 1-3m

IMPROVED WATER-WHEEL,

—PATENTED BY—

JOHN TYLER, WEST LEBANON, N. H.

Giving the Maximum Power with the Minimum Cost; Having the Following as Some of Its Advantages Over Others—Giving the Best Percentage of Water Used, Durability,

It runs Equally as well IN Back Water as OUT.

IT IS ADAPTED TO HIGH HEADS OR LOW—IT IS NOT LIABLE to get out of repair—It can be put to running by any Machinist in a very short time—It is the steadiest running and easiest regulated wheel in use—There are now some 500 of them in use in the United States and Canadas, running under all heads, from 4 to 80 feet, and giving universal satisfaction. Address

SMITH & HANSCOM,

15v8-3m Golden State Iron Works, San Francisco.

DUNBAR'S

PATENT SELF-ADJUSTING

Piston-Packing.

Requires no Springs or Screws; Is always Steam Tight, without excessive friction, and never gets slack or leaky.

IT WILL SAVE EACH SEASON MANY TIMES ITS COST in friction, time, steam and power. No engine, old or new, should be without it. It can be easily fitted to old or new Pistons.

Having obtained the Agency of this VALUABLE IMPROVEMENT, I am prepared to furnish it wherever desired. For further information, address HENRY S. SMITH,

23v8 Golden State Iron Works, San Francisco.

HUNT'S

IMPROVED WIND-MILL.

THIS WIND-MILL IS RAPIDLY taking the place of all other Mills on the Pacific Coast. These Mills are so simple in their construction, that when once built, they can be put in order by almost any person; and when once in order they will run for years without repairs.

Prices, from $50 to $1,000.

ROUND AND SQUARE WATER TANKS BUILT TO ORDER.

HUNT'S PUMPS

Are admitted to be the best in the Market for Wind Mills, being built expressly for that purpose. They can be set, and taken apart with a common wrench, and are very easily repaired.

HUNT'S ENDLESS CHAIN

HORSE POWER

For Sawing Wood.

ALSO, THE

Self-Regulating Horse Power

Is so arranged as to give a steady motion, and is calculated to be used for turning Wood, Iron or Brass, also for Scroll or Circular Sawing, and is fully equal to Steam for any light work. The above Machines are built of the best materials, and made as Durable as Wood and Iron will make them.

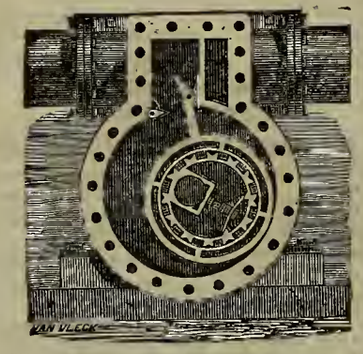
ALL WORK WARRANTED.

☞ For further Particulars see small circulars. ☜

E. O. HUNT,

No. 28 Second Street, and 108 & 112 Jessie Street, San Francisco. 26-3m

HARRISON'S ECCENTRIC PUMP.



This pump is designed for throwing large quantities of water, either as a wrecking pump, a mining pump, or for irrigation. Its principal advantages are that it is light and compact, very durable and not at all liable to choke or get out of order.

It has no valves and no packing. It is a suction and force pump, and has sucked water up over 27½ feet.

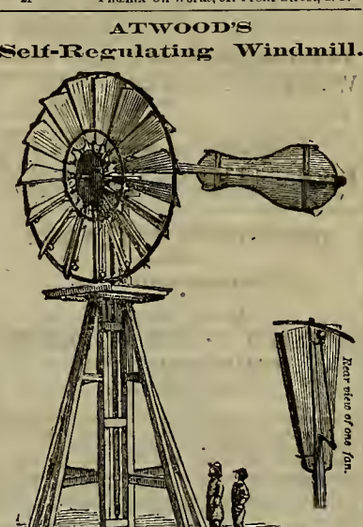
It can run fast or slow, and according to its speed is the quantity of water discharged.

All sizes, capable of throwing from 100 to 5000 gallons per minute. For sale by **C. H. HARRISON,**

21 Phœnix Oil Works, 517 Front Street, S. F.

ATWOOD'S

Self-Regulating Windmill.



This windmill is the most perfect self-regulator yet invented, and is capable of being adjusted to any desired speed. Manufactured at

222 Mission Street, North side, below Beale,

SAN FRANCISCO.

N. B.—We also manufacture DICKERSON'S SELF-REGULATING MILLS; also, Rotary and Stationary Mills of different styles and prices, varying from $50 to $500 each; also round and square Water Tanks made to order.

222 Mission street, below Beale. 5

TO QUARTZ MINERS.

Hinkle's Centrifugal Pulverizer and Amalgamator!

THE ATTENTION OF MINERS IS RESPECTFULLY requested to HINKLE'S CENTRIFUGAL PULVERIZER AND AMALGAMATOR, now manufactured and to be seen in operation at the NOVELTY IRON WORKS of Mr. E. T. Steen, Nos. 37 & 39 Fremont street, between Market and Mission streets.

This machine is the best in the State for the purpose of Pulverizing and Amalgamating ORES. The whole machine, made entirely of iron, will not exceed One Ton, and no piece of it will exceed 200 pounds, which makes it very convenient for transportation to remote districts. It will work Two Tons of Rock per day.

Mr. Hanson, who is running one of the machines, is an experienced Amalgamator, and will receive Ores at the above named place, and extract the metals and furnish assays for all persons wishing the same. The Subscriber is also perfecting a HAND MACHINE for Miners engaged in prospecting, which will work 25 pounds of ROCK at a time, and which will weigh about 125 pounds.

The Pulverizer and Amalgamator works Rock of the size of a grain of corn to an impalpable powder. Apply to

PHILIP HINKLE,

At the Novelty Iron Works, Nos. 37 & 39 Fremont street.

SALMON'S

PROPELLER AMALGAMATOR.

The proprietors and inventors of this machine, after fourteen years of practical experience in mining in California and Nevada Territory, and having a thorough knowledge of the wants of Miners and Mill men, have succeeded in making an Amalgamator, which, for the purposes intended, far surpasses any other yet presented to the public, and which can be furnished at less than one half of the expense of any other Amalgamator, now in use, besides requiring less labor to clean and keep it in running order. The Amalgamator is simple in its construction, consisting of a pan or tub constructed of wood and adapted to either a Stone or Iron bottom. Opposite each other, and on the inside of the tub, are two flanges, from two to four inches broad, reaching from the top to near the bottom, with room for the mullers to pass under. These flanges are for the purpose of preventing the pulp from forming a circular current, and together with a number of wings placed like a screw propeller on the muller-shaft, force a current continually on the quicksilver at the bottom and under the grinding surface of the mullers. This peculiarity of propeller-screw and side wings, in combination with a deep tub, are what the proprietors claim as new and for which a patent has been applied for. The Inventors of this machine are practical Mechanics as well as experienced miners, and the machine offered by them to the public is the result of long experience and close observation. Manufactured at the San Francisco Foundry, San Francisco, Cal. by

J. & W. C. SALMON,

KELLOGG'S PATENT

IMPROVED NEWBURY

PRINTING PRESS.

This New, Cheap, and most Desirable

JOB PRINTING PRESS

Can now be seen in operation in San Francisco, at the office of the MINING AND SCIENTIFIC PRESS, corner of Washington and Sansome streets.

Kellogg's Improvement

Is the addition of a very simple, but ingenious and effective method of self-delivering of the cards or printed sheets from the Newbury Press.

It costs less, weighs less, and prints faster than any of the ordinary Job Presses now in use. Any Journeyman or Apprentice, who understands working the Washington hand-press, will have no difficulty in operating this machine.

As a Cheap and Simple Press, for small Printing Offices in the interior, it highly recommends itself.

J. M. BUFFINGTON, Secretary.

Office, Nos. 8 & 10 Government House, corner Washington and Sansome Streets, San Francisco, Cal. oct29-18

Evening Star Gold and Silver Mining Company. Trinity District, Humboldt County, N. T.

The Annual Meeting of the Stockholders of the above company, for the election of Trustees to serve for the ensuing year, will be held at the office of the Company, No. 710 Sansome street, on Thursday, the 10th day of November, 1864.

18-2 N. DUPERU, Secretary

INVENTORS AND INVENTIONS.—Let us not cheapen inventions, but be kind to the inventors; beware of killing the goose that lays the golden egg! Many inventors die before the hour of triumph; others falter by the way. Invention is a struggle, a conflict, almost a battle; if the victors are rewarded, the dead are honored and the wounded carefully attended to. Glorify the inventors who succeed; cover with an indulgent self-respect the faults of those who fail; and soothe the last years of the wounded—those invalids of industrial science who have known only the pains of the fight, and always remained ignorant of the joys of victory. —[Dumas.

RAILROAD HOUSE.

316, 318 & 320 Commercial Street,

SAN FRANCISCO.

THE Undersigned respectfully notifies his Patrons, and the Public generally, that he has assumed the entire charge of above popular House, and having had it thoroughly renovated, he flatters himself it will compare favorably, in point of comfort and cleanliness, with any House in the city. It is his intention to make it a First Class

Family Hotel.

Being conducted on the European plan. It is not only the CHEAPEST RESPECTABLE HOTEL, but the most convenient as guests can choose their own hours of eating. The Restaurant is now conducted by G. V. DAWSON, Esq., formerly of Sacramento, late of Marysville, whose name is a sufficient guarantee of the best of living.

The Railroad House Coach conveys passengers to the hotel FREE. Barber Shop, Bath Rooms, Steam Baths, etc., connected with the House.

18-q **C. L. ROSS, Proprietor.**

BRANDRETH'S VEGETABLE PILLS.—Forty Millions of People have used and approved this Great Medicine, whose use reduces the Death Principle, causes your sickness to leave you, and smiling health to return. Often in disease of twenty years' standing they effect a perfect cure where all hope had fled. Sold by all Druggists.

NEW SHAFT OF THE GOULD AND CURRY MINE.—The Virginia *Union* thus mentions the new shaft of the Gould & Curry mine, in D street, Virginia City.

The new shaft is at the mouth of their upper tunnel, and is sunk about in the center of the street. It was commenced only a short time ago, and is now down to the depth of 175 feet. The shaft is a very large one, being 22½ feet long by 7½ feet wide, heavily timbered with 14 inch timbers, from top to bottom, and is divided into four different compartments, each 4½ by 5 feet in the clear. In sinking and timbering three men are employed below, and two above, independent of the whim driver, working eight hours to a "shift." Thus, three "shifts" keep the work constantly going ahead. The hoisting is all done by means of the most substantial whim in the Territory, the drum of which is 12 feet in diameter, and it is navigated by one horse. A large force of carpenters are at work fitting timbers, etc., and the whole operation employs about 40 men. The rock which comes out is a soft, blue "bed rock," which is readily picked, and no blasting has to be done; but yet, such is the size of the shaft and the amount of timber used, that it costs about $200 per foot. They will soon have to erect steam hoisting works there in place of a whim, that being too slow an operation for any great depth. They propose sinking this shaft 1,500 feet, at which depth they expect to strike the Comstock tolerably rich. At the depth of 234 feet they will connect with their lower tunnel—which lies about 200 feet south—by means of a branch tunnel, and the debris from this shaft will then be run out through it. The old or upper tunnel was run in 1860, and is 500 feet in length, running from D street to the ledge, but it has been but little used since the lower tunnel was run. It commenced caving four or five weeks ago, and continued until the whole of the end near the ledge was entirely destroyed, and a large cavity formed at that point, which, however, exposed a large quantity of rich ore, not known of before. The tunnel is now being cleaned out and reconstructed, in order to get at the aforesaid good ore.

SUSPENDED.—Work at Mare Island has been nearly all suspended and the laborers discharged.

Important to Secretaries.

Secretaries will please write proper names and figures distinctly, and hand in their advertisements as early in the week as practicable. Our latest forms go to press Friday evening. Any information concerning the requirements of the laws regarding advertisements will be cheerfully given when solicited. Inspect all your notices carefully upon their first appearance. In case of postponement, give the earliest notice possible at the office. When copy is received sufficiently early, a proof-sheet will be furnished if desired. A revised copy rendered, for advertising at the mine, when requested. Neatly printed copies of advertisements, for serving individual notice to stockholders, printed at $1 per hundred. Copies of the new advertising law, as officially published, furnished gratuitously. ☞ Blank forms, for filling out Assessment Notices and Delinquent Sales, supplied free to advertisers in the MINING AND SCIENTIFIC PRESS on application at the office

For Advertising Assessments on Saturdays.

Levy your Assessments upon any day EXCEPT FRIDAY.

Advertise the ASSESSMENT NOTICE on the FIRST FOUR SATURDAYS succeeding the day upon which the assessment is levied.

Appoint the day for advertising the DELINQUENT SALE on the FIFTH SATURDAY succeeding the date of levying the assessment.

Appoint the DAY OF SALE on the SEVENTH SATURDAY succeeding the date of levying the assessment, or any day *previous* to the Eighth Saturday.

Assessments ordered upon Saturday afford the Secretary the longest term in which to effect his advertising at the mine.

Extracts from the Statutes.

The attention of companies who desire advertising their delinquent sales in any other paper than that in which the notice of assessment appears, is called to the following section of the law approved April 4th, 1864:

Section 7. If any portion of the assessment mentioned in said notice shall remain unpaid on the day specified therein for the publication of the notice of sale, the Secretary shall, *unless otherwise ordered by the Board of Trustees*, cause to be published in the same papers in which the notice provided for in section five shall have been published, a notice substantially as follows, &c.

If, from a matter of convenience or necessity, the publication of an assessment is delayed, a very simple remedy is found in the following section of the law, relating thereto:

Section 14. No assessment duly levied shall be rendered invalid by a failure to make proper publication of the notices hereinbefore provided for, nor by the nonperformance of any act required to be performed in order to enforce the payment of the same; but in case of any substantial error or omission in the course of proceedings for collection, all previous proceedings, except the levying of the assessment, shall be void, and publication shall be begun anew.

Our Patent Agency.

The PATENT AGENCY of the MINING AND SCIENTIFIC PRESS has been signalized with remarkable success during the past two years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of LETTERS PATENT from the United States and foreign Governments cannot be over-rated, and the Proprietors of the PRESS, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

ENLARGEMENT.—The Mining and Scientific Press has again been enlarged by the addition of a fourth column to every page. It is conducted with ability and enterprise, and is meeting with the constantly increasing patronage which it deserves. There is a straightforwardness and fearlessness about it which we admire.—*S. F. Evening.*

BRANDRETH'S PILLS.—The weak, the consumptive, rheumatic, costive, bilious and delicate, after one day's use will find renewed strength and life pervade every organ of their frames. Sold by all Druggists.

Corner of Washington and Sansome Streets, San Francisco.

Putnam's Clothes Wringer.

IT IS THE ONLY RELIABLE SELF-ADJUSTING WRINGER. No wood-work to swell or split. No thumb-screws to get out of order. Warranted with or without cog-wheels. It took the FIRST PREMIUM at Fifty-Seven State and County Fairs in 1863, and is WITHOUT AN EXCEPTION the best Wringer ever made. Patented in the United States, England, Canada and Australia. Agents wanted in every town, and in all parts of the world. Energetic agents can make from three to ten dollars per day. Sample Wringer sent Express-paid on receipt of price. No. 2, $6.50. No. 1, $7.50. No. F. $8.50. No. A. $9.50. Manufactured and Sold, wholesale and retail, by

THE PUTNAM MANUFACTURING CO.,

No 13 Platt Street, New York, Cleveland, Ohio and Bennington, Vt. S. C. NORTHROP, Agent.

What Everybody Knows,

Viz: That Iron well galvanized WILL NOT RUST; That a simple machine is better than a complicated one; That a Wringer should be self-adjusting, durable and efficient; That Thumb-Screws and Fastenings cause delay and trouble to regulate and keep in order; That wood soaked in hot water will swell, shrink and split; That wood bearings for the shaft to run in will wear out; That the Putnam Wringer, with or without cog-wheels, will not tear the clothes; That cog-wheel regulators are not essential; That the Putnam Wringer has ALL the advantages, and not one of the disadvantages above named; That all who have tested it, pronounce it the best Wringer ever made; That it will wring a Thread or a Bed-Quilt without alteration.

We might fill the paper with testimonials, but insert only a few to convince the skeptical, if such there be; and we say to all, TEST Putnam's Wringer. Test it THOROUGHLY with any and all others, and if not entirely satisfactory, return it.

Putnam Manufacturing Co:—

GENTLEMEN. I know from practical experience that iron well galvanized with zinc will not oxydize or rust one particle. The Putnam Wringer is as near perfect as possible, and I can cheerfully recommend it to be the best in use. Respectfully yours,

JNO. W. WHEELER, Cleveland, Ohio.

Many years experience in the galvanizing business enables me to endorse the above statements in all particulars.

New York, Jan., 1864. JNO. C. LEFFERTS.
No. 100 Beekman St.

We have tested Putnam's Clothes Wringer by practical working, and know that it will do. It is cheap; it is simple; it requires no room, whether at work or at rest; a child can operate it. It does its duty thoroughly; it saves time and it saves wear and tear. We earnestly advise all who have much washing to do, with all intelligent persons who have any, to buy this Wringer. It will pay for itself in a year at most. HON. HORACE GREELEY.

6-tf

How to make your Remittances.—In most of the mining towns, bankers will furnish checks on San Francisco at par, (or at a very slight advance) to those who wish to pay us for subscriptions, advertising, mining blanks, etc. When it is more convenient, money may be remitted by mail at our risk if the parties sending will register their letters. Money sent by mail is seldom lost if properly enclosed. An excellent method is that of opening the layers of a card, placing the coins between the layers and sealing the edges together.

Owen's River Canal Company.

CAPITAL STOCK.....$1,000,000

10,000 Shares.....$100 per Share.

A PORTION OF THIS STOCK IS NOW OFFERED TO THE public, and recommended as an investment.

READY ROOFING

READY TO NAIL DOWN.

READY ROOFING

At less than half the cost of tin roofs.

READY ROOFING

More durable than Tin.

READY ROOFING

Suitable for steep or flat roofs.

READY ROOFING

For all kinds of buildings, in all climates.

READY ROOFING

Easily, cheaply, and quickly put on. Needs no coating over with cement after it is nailed down.

READY ROOFING

Made of a strong woven fabric, thoroughly saturated and covered upon both surfaces with a perfectly water-proof composition, and put up in rolls ready for use—40 inch wide, and 75 foot long.

WE ALSO MANUFACTURE

Liquid Cement,

FOR LEAKY TIN ROOFS.

Much cheaper and more durable than oil paint. Also,

Compound Cement,

For Leaky Shingle Roofs,

Which will often save the cost of a new roof.

Samples of Ready Roofing and Circulars sent by mail when desired. Favorable terms made with responsible parties who buy to sell again.

READY ROOFING CO.,

Mining Notices--Continued.

Arizona Consolidated Mining Company, Eureka District, Arizona Territory.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 19th day of October, 1864, an assessment of 20 cents per share was levied upon the Capital Stock of said Company, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, No. 723 Montgomery Street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on Saturday, the 19th day of November, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 3d day of December, 1864, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

N. G. FRENCH, Secretary.
Office, 723 Montgomery street, San Francisco. 17-4

Caledonia Tunnel and Mining Company, Gold Hill District, Nevada Territory. Office, No. 8 & 10, Government House, corner Washington and Sansome streets, San Francisco.

Notice is hereby given that the Annual Meeting of the Stockholders of the Caledonia Tunnel and Mining Company, for the election of Trustees for the ensuing year, will be held at the office of the Secretary, on Monday, November 14th, 1864, at 2 o'clock P. M. of that day.

16-5 J. M. BUFFINGTON, Secretary.

Crown Point Ravine Gold and Silver Mining Gold Hill District, Nevada Territory. Office, Nos. 8 & 10 Government House, corner of Washington and Sansome Streets, San Francisco.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 28th day of September, 1864, an assessment of five dollars per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary at his office, or to JAS. B. COFFEY, Virginia City, Nevada Territory.

Any stock upon which said assessment shall remain unpaid on the 1st day of November, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on the 16th day of November, 1864, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

Citizen's Coal Mining Company, Mount Diablo District, Contra Costa County, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 14th day of October, 1864, an Assessment (No. 10) of $5. per share was levied on the Capital Stock of said Company, payable on the 20th day of October, 1864, in United States gold coin to the Secretary, E. J. PFEIFFER, at the office of the Company, S. W. Corner Post and Dupont streets.

Any stock upon which said Assessment shall remain unpaid on Saturday, the 12th day of November, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday the 26th day of November, 1864, to pay the delinquent Assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

E. J. PFEIFFER, Secretary.
16-4t Office, S. W. Corner, Post and Dupont Sts.

And in accordance with law, and an order of the Board of Trustees, made on the 13th day of September, 1864, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of the company, No. 6 3 Montgomery street, San Francisco, on Tuesday, the 1st day of November, 1864, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

GEO. A. HILL, Secretary,

Office, No. 523 Montgomery Street, San Francisco, Cal. 15

United States Mining Company, Virginia Distriot, N. T.

Notice is heraby given, that at a meeting of the Board of Trustees of said Company, held on the 20th day of September, 1864, an assessment of one dollar per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary, at his office, or to J. B. COFFEY, Virginia, Nevada Territory

Any stock upon which said Assessment shall remain unpaid on Monday the 31st day of October, 1864, will be advertised on that day as delinquent, and, unless payment shall be made before, will be sold on Wednesday the 16th day of November, 1864, at 12 o'clock M., to pay the delinquent assesment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

J. M. BUFFINGTON, Secretary.

Office, Rooms No. 8 & 10 Government House, corner of Sansome and Washington sts., San Francisco, Cal. 14

Conclured from page 281.

our homes as the sewing machine. The click of these wonderful instruments may be heard resounding in the drawing room of the palatial residenee of the millionaire, stitching away with tireless energy upon the rich material of some costly article of luxury, or in the cheerless garret of squallid poverty, making shirts and pants for soulless contractors, making music as merrily in one as well as the other. This machine, the introduetion of which has produeed sueh astonishing results, has been so much improved upon that there is no deseription of needle-work from the hard laborious work of the saddler and boot maker, to the fragile work of the milliner, some of whose muslins approach the gossamer in fineness, but what can be accomplished by these improved maehines. The marked improvement in the public taste in dress, the elegant stitching that decorates so charmingly the elothing of the children of the poor, would never have been accomplished without the introduetion and improvement of the Sewing Machine. So brilliant and rapid has been the suceess of American genius as displayed in the iuvention, improvement and manufacture of Sewing Machines, that no other country in the world has produced the man who has attempted to compete with our own inventors in the production of this universally useful and important instrument. In these days of imitation and progress, this fact appears prominent and singular in the history of the present. It is one of the highest compliments yet recorded in the triumph of American genius. None but "Yankee" sewing machines have yet been known. There are more than 500 improvements claimed by patent agents on the original machine—many of them really valuable in themselves, but, scattered through so many otherwise defective instruments, they are like a divided people, not near as effeetive for good as they would be were they united.

While, as we have above stated, a large number of sewing machines have been offered to the public, some of which possess points of excellence and acknowledged merit, the necessity of a machine more perfeet in its mechanical structure has long been felt—a maehine to combine, in the highest degree, *simplicity* with *durability*, and while capable of doing a *greater range of work*, one that could be easily understood and comprehended by all.

To supply a sewing machine free from the objections attached to others, has been no easy task; by a liberal expenditure of eapital, and the patient untiring labor of years, this is boldly claimed to have been accomplished by the Florence Sewing Machiue Co., of Florence, Massachusetts.

Discarding the chain and loop, or knit stitches, they adopt the loek stitch, (alike on both sides of the fabric,) which is regarded by the masses as best suited to all kinds of work. They also add the knot, double lock, and double knot, either of which is *stronger and more elastic* thau the lock; thus enabling the operator to select a stitch perfeetly suited to every grade of fabric, and wheu neeessary, sew seams mueh stronger than it is possible to do by hand.

Adding the three stitches would seem to require a complication of maehinery, and thus render the maehine impracticable; *but such is not the fact.* It makes the *four stitches* with as mueh ease and facility as ordinary maehines make one stitch, and *with as little if not less machinery.*

To have them thoroughly tested before presenting them to the public they were plaeed in manufactories and families, where a severe trial would expose any weak points. The result was all that could be desired; and from its first introductiou the "Florenee" has gained a host of friends.

We can only mention, for want of space, a few of the peculiar advantages of this new machine: It has the *reversible feed motion*, which enables the operator, by simply turning a thumb screw, to have the work run either to the right or left, to stay any part of a seam, or fasten the ends of the seam, without turning the fabric; it runs lightly and sews rapidly; it does the heaviest or finest work *without change of tension or machinery.* This, in our opinion, is its most useful feature. We have no hesitation in prononncing this machine (having given it a careful inspection) as inferior to none, in its many important features.

1852. 1864.

TWELFTH YEAR OF PUBLICATION.

THE GOLDEN ERA,

Founded in 1852.

The oldest Weekly Paper in the State, permanently estnblished, and more widely circulated at homo nud abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, The Golden Era is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent, and correspondents of distinguished ability in New York, Paris and London.

The Golden Era is now enlarged by the addition of eight columns to its pages—and presents fifty six columns containing the greatest possible variety of Valuable and Entertaining, Original and Selected Matter, all combining to render The Golden Era a Literary and Family Journal of surpassing interest and attraction; a Welcome Guest in Cottage and Cabin; the favorite at the fireside in City and Country, the most useful, agreeable altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe, and elsewhere. Every Household in the Mountains and Valleys, the Cities, Towns, and Mining Camps of California and throughout he Pacific States and Territories, should receive and welcome The Golden Era as a regular weekly visitor.

Serial Romances in the Golden Era.

The most popular Novels of the present day—
"THE DOCTOR'S WIFE," by Miss Braddon.
"OUR MUTUAL FRIEND," by Charles Dickens;
published as Serials, from week to week, in The Golden Era, from advance sheets, simultaneously with their appearance in the English and Atlantic Periodicals.

Among the Contributors to the Golden Era are all the prominent writers of Literary Repute in California, and on the Pacific Coast; also correspondents and contributors of distinguished talent in the Atlantic States and Europe; including "Orpheus C. Kerr," Fitz Hugh Ludlow, G. B. Densmore, "Mark Twain," Dan De Quille, Florence Fane, Miss Emma Hardinge, Sarah E. Carmichael, Annie E. Fitzgerald, "Occasia Owen," Alice Mason, William Simpson, Chas. F. Stoddart, "Iua," H. C. Willistou, "Albion," "Fairfax," Bonnovel, Mary Kyle Dallas, Margaret Hosmer, and many other accomplished writers of Fiction, Romance, Novels and Stories, Poetry, Essays, Sketches, etc., etc., comprising an array of Talent and Genius unapproached by any Literary Journal in California, the Atlantic States or Europe.

The proprietors of the Golden Era announce the receipt of advance Sheets of Miss M. E. Braddon's New Novel,

The Doctor's Wife,

The most brilliant effort of the celebrated author of "Aurora Floyd;" "The Outcasts;" "Three Times Dead;" "Lady Audley's Secret;" etc., etc.

"THE DOCTOR'S WIFE," now in course of publication in London, is universally pronounced to be Miss Braddon's greatest production. It will be completed in sixteen numbers of The Golden Era.

SAN FRANCISCO, SATURDAY, NOVEMBER 5, 1864.

VOLUME IX. Number 19.

[Written for the Mining and Scientific Press.]

OUR IRON CLADS—THEIR CREATION.

In June, 1861, Congress made the first appropriation for the building of armored vessels for our Navy. France as well as England had several large and small armored vessels afloat at that time; with our principal navy officials, these ships seemed not to be regarded favorably; but after a delay of some months, the Navy Department concluded to make use of the appropriation of Congress, amounting to $1,500,000. They appealed to the Engineers of the country to submit plans for armored vessels and out of a great number submitted to them, they choose three, according to which plans our first three armored ships have been built.

The first vessel was the Galena, a medium sized wooden war ship substantially built, with tumbling insides, which were covered with narrow 2½ iron plates overlaping each other and fastened with through bolts, having the washer and nut inside the boat. The worthlessness of this boat, as an iron-clad was duly demonstrated in the fight with Fort Darling on James River, in June, 1862, where her sides were riddled with shot, and where the nuts of the through bolts flying all over the gun deck, the moment a plate outside was struck, played sad havoc amongst her devoted crew. The plating has since been removed off her sides and she is doing service as a gunboat. Lately she took an honorable part in the battles in Mobile Bay.

The greatest part of the money appropriated was spent in constructing the justly celebrated frigate New Ironsides. She is a wooden vessel of very superior material and workmanship, in building her the builders seem to have used La Gloir, the prototype of all European Iron Clad fleets, as their guide, although our ship is undoubtedly an improvement over the French ship. Both ships are of equal length 275 feet, but the New Ironsides has a considerable greater beam, her lines fore and aft are very full (she being a poor model for speed), which gives her a greater displacement and consequently less draught of water. Her armor plates, which are 4½ inches thick, are fastened with wood screws, a decided advantage over the French fastening with through bolts. The New Ironsides carries a far heavier battery, considerably higher above the water line than La Gloir's; in fact with the exception of speed our ship is far superior to the French ship. The fore and aft lines of the French ship are extremely fine, her engines are almost double the size of those of the New Ironsides, which would in case of a conflict between both, more than atone for other advantages our ship has. The New Ironsides has been engaged more than a dozen times and has been hit over 200 times by the heaviest modern projectiles, without having received any other injury than the cracking of a few plates of her armor.

The third craft was the "Monitor," the main features of this vessel are too well known to deserve any further notice. The result of the battle in Hampton roads inspired the nation justly with a high opinion of vessels of this class; whether it was wise to devote the resources of the nation to the building of these vessels only to the exclusion of almost all other forms of iron clads, is quite another question, which gives a wide scope to discussion. Besides the New Ironsides we have a few other iron clads, ranking for their size, first class.

The Roanoke was originally a wooden ship, built in 1855 at the Gosport Navy-Yard, and a sistership of the Merrimac. In 1862 she was cut down, armor-plated and equipped with three turrets. Her performances at sea seem not to have been very satisfactory, as she was moored at Fortress Monroe, where she has been lying ever since, being of no other use than to serve in case of need as a floating battery there.

The Dictator, a monitor built for sea service, is 326 feet long, 50 feet wide, draws 21 feet of water and is to be only 22 inches out of water. She rates 3033 tons, carries only one turret, containing two 15-inch guns, and was to have been ready for service in the beginning of October.

The Puritan, also a monitor, 356 feet long, other dimensions like the Dictator's, rated at 3265 tons, is to have two turrets. Work has been stopped on her since July. If recommenced now, it would take about nine months to finish her for service, only a few of the heavier pieces of her machinery are in position.

The Dunderberg, is in the stocks yet although as far as her hull is concerned, she has been ready for launching these last eight months, but the machinery is in such a state of backwardness, that those pieces which must be in position when the ship is to be launched, have not been finished yet. This ship is the only casemate ship built for our navy so far. She is to have two turrets on top of her casemate, she is the largest war vessel of our navy, and when afloat will doubtless be the most effective and terrible engine of war ever built. She is 375 feet long, 78 feet wide and 27 feet deep, she is to draw about 21 feet of water; her bow projects 50 feet forward of the ship proper, is of solid oak, heavily braced and iron clad and forms a terrible ram; her sides are at the floor three feet thick increasing to seven feet solid oak at the water-line, from the level of her deck down her sides eleven feet, she is covered with 4½ inch iron plates, which are unlike other ships' armor plates, fastened vertically. The casemate on her deck is 160 feet long and the width of the ship, formed of three feet oak covered with 4½ inch plates, the sides being inclined at an angle of 45°. The Dunderberg is to have ten of the heaviest guns used in our navy. Her motive power is derived from two engines, 100 inches diameter of cylinder, and 48 inches stroke of piston, which her builder expects to drive her at the rate of fourteen nautical miles an hour; an expectation which is sure not to be realized. The vessel resembles much like an immense scow, her bottom is dead flat, her bilge having only 30 inch radius, so that in spite of her very fine lines forward, which, many consider too concave, her form is not one for speed, besides there is her immense overhung aft, for protection of her propeller, which will not only increase her friction surface, but have a dead drag, as the water will not be able to escape readily from under it. If we compare her power and immersed-midship section with those of some other armored ships, we find, she has not as much power as she ought to have, leaving her form out of consideration.

	Midship-section.	Engines 2 cyl
Dunderberg,	1450 square feet.	100 x 48 inches.
Warrior, (English)	1280 square feet.	112 x 72 inches.
Black Prince, (English)	1290 square feet.	112 x 72 inches.
Magenta & Solferino, (Fr.)	1220 square feet.	100 x 48 inches.
La Gloir, (French)	1115 square feet.	84 x 48 inches.
Don Juan, (Austria)	1180 square feet.	85 x 48 inches.
Ferdinand,	1150 square feet.	85 x 48 inches.

The fastest of these ships, the Warrior, made fourteen nautical miles at her official trial in Stokes bay; but on going in sea she never made over twelve and a half nautical miles neither did the Black Prince; these ships are entirely of iron. The French and Austrian ships being of wood; these latter ships never made over eleven nautical miles. The "Don Juan" and "Ferdinand" in going from the Adriatic to the German Ocean, in the late war with Denmark, never made more than that; the French ships not even coming up to this; and yet these ships have more favorable models for speed than the Dunderberg, (her model was necessary, in order not to make her draw too much water; all the above named ships draw from two to five feet, more water than the Dunderberg will).

The ship has room for another pair of such engines as she has now, with two propellers like the one she has now 21 feet diameter, 32 feet medium pitch, driven by two pairs of 100x48 inch engines, we might expect her to be not only the strongest but also the fastest war vessel. Supposing for a moment her present power would drive her at the rate of twelve miles an hour (which she will not reach) she would make nearly sixteen miles with her power doubled, and if she was to strike anything at that speed, the effect of her stroke would be equal to the effect of a cannon ball 10 feet 11 inches diameter, travelling with a velocity of 1500 feet per second. Two screws are an immense advantage in maneuvering a ship; it is to be pitied that this ship was not been designed for double the power, driving two screws.

Shortly after the battle in Hampton roads, the building of our present monitor fleet commenced, comprising four batches, distinguished by their size only. The first batch consists of nine vessels 200 feet long by 40 feet wide, 12 feet deep; they carry one turret each, containing one XV inch gun, and one 150 lb Parrott rifled gun. The second batch also consists of nine vessels 235 feet long, 45 feet wide and 13 feet deep, carrying one turret each, armed with two XV inch guns. The third batch comprises only four vessels, they are building at the different navy-yards and are built of wood, also of a somewhat larger size than the others; none of these are finished. The fourth batch comprises the so called light draft monitors; none of these are finished yet they are 225 feet long, 44 feet wide and 9 feet deep.

Besides these we have a fleet of twenty-one armored vessels on our western rivers, swelling our fleet of iron clads to 69 vessels of all classes, rating 77560 tons and carrying 216 of the heaviest guns in use. As regards the defensive power of these ships, they are all unquestionably superior, to anything built in Europe. The same must be said of their offensive power, as far as this term applies to their armament, but when applied to their speed, they are, with the exception of a few river steamers, greatly inferior to the European armored vessels the reason is, that all our ships have too small engines, for their size, a mistake which has not only been made in our armored vessels, but also in our wooden men-of-war built lately; our fastest war vessels being amongst those built before the outbreak of the rebellion.

New York. H. H.

What they Eat in France.—A London journal has an interesting article on the subject of human food as cooked in Paris, the city of epicures and luxury, and the revelations are certainly very startling. The article is based on the statements in the *Society of Arts Journal*. From the statements in the journal named, it appears that an establishment exists at Belleville, an outskirt of the French metropolis, for the special purpose of raising poultry. It consists of thirty acres of land, and is capable of accommodating 300,000 poulets at a time. The poulets are said to be divided into parties, according to their age, and each party has its yard and dormitory, and the food consists almost entirely of horse-flesh, supplied from a slaughter house adjoining the farm, and belonging to the same proprietor! This mode of feeding the poultry is kept a secret from a fear of offending popular prejudice; but the extent of the system may be inferred from the fact that the farm sends to market every week no less than 40,000 eggs, at 6d. per dozen. A little grain is given with the horse-flesh, and under this strange diet the hens lay all the year round, and the production of eggs is found to be more profitable than the sale of the chickens. No wonder the system is worked in secrecy, remembering how largely poultry enters into French cookery, and the fact of the omelette being flavored with horse-flesh would disgust all the gourmands in Paris. But to proceed. The hatching apparatus on the farm occupies the attention of fifty or sixty women, as under the stimulating effects of horse-flesh the hens will not cover their own eggs. At the end of four years the hens cease to lay; they are then fattened for three with bruised grain and sent to market alive. Nothing can exceed the care and calculation with which every department of this strange and revolting business is conducted. The blood of the horses is carefully saved, and fetches a good price; the hides go to the tanners; the beads and hoofs to the Prussian glue makers; the marrow to the perfumers; the large bones to the button-makers; the refuse is converted into manure—a most important product—and the flesh, as we have seen, is given to the poultry."

Drawing Iron.—When a bar of wrought iron is broken by a weight being placed upon it, it is supposed by many persons that the remaining parts are rendered weaker than they were before, on account of the strain to which they have been subjected. This is a mistaken idea. Such pieces of iron bars are generally stronger, according to their diameter, than they were before the bar was broken. The strain to which they have been subjected, by drawing the fibers closer together, increases their density, and, as a consequence, the strength of the metal. A wire of one-eighth of an inch in thickness is, *proportionably*, stronger than one twice the thickness, simply because its fibres are packed closer together by the operation of drawing.

Morning Air.—The Medical Journal says it is a common and favorite notion with many people that the morning air is the purest—most bracing—but the opposite is the fact. The air is full of dampness, fog, and miasm, at about sunrise, which the sun however, soon dissipates. Before engaging in anything like exercise or work in the early morning out of doors, it is conducive to health to take a warm cup of coffee, if breakfast is not to be had.

New and rich quartz diggings have been discovered at Silver City, in Idaho Territory.

NEW DEVELOPMENTS IN GRASS VALLEY.

We have elsewhere made some general notice of what is now doing in Grass Valley in the way of quartz mining. A visit to "New District," as it is called, has enabled us to collect the following facts with regard to what is now doing in that section. Our first stop was at the

Coe Co's Ground, or the old "Day Diggings," which were first worked in 1851, by Capt. Day, but not proved to any considerable depth, until recently. The claim consists of 3,000 feet, and is supposed to be an extension of the Eureka lead, owned by Mr. Jules Fricot, familiarly known here as the "Emperor." This ground has recently been purchased by Messrs. L. W. Coe, A. E. Davis and Joseph Woodworth of San Francisco, and Geo. D. Roberts of Grass Valley. These gentlemen are now erecting a steam pump, preparatory to putting down a deep shaft, and thoroughly opening the mine for extensive working. They will also erect a mill upon the vein. The rock at the point now reached by the shaft looks well, and the enterprise is regarded as one of almost certain success. A few months ago this claim was nearly valueless. The extraordinary success attendant upon the deep shaft sunk on the adjoining ground by Mr. Fricot, induced the proprietors to go a little deeper on with their old shaft, which has been attended with such encouraging results as to fully justify the erection of machinery.

Fricot & Co., next adjoining, worked their mine for several years above the water level, the rock paying but a trifle over the cost of mining and milling. The company recently put up a steam pump and went down about one hundred feet, where they commenced drifting and found the rock paid some three or four times as much as it did above the water line. Up to the present time they have hauled the rock some two miles to the French mill in Boston Ravine. They have now stopped hauling and are erecting a 20-stamp mill at the mine which will be in operation in a few weeks. They are still sinking their main shaft which is now about 200 feet deep. They have a large amount of ore on the surface ready for the mill, which will pay fully $40 to the ton on an average. Some of it will go nearly double that amount. This is now looked upon as one of the most valuable mines in the state.

Spring Hill, is a ledge running parallel to the Eureka, which has recently been purchased by Messrs. A. E. Head, a successful Washoe miner, Mr. Robert Morrill, of Nevada, and Mr. G. D. Roberts of Grass Valley. There are 1800 feet in the claim. The ledge is a very large one, has been worked for some two years on the surface, and has already been proved to be a valuable mine. The present proprietors intend working it thoroughly, and to do so will put up a steam pump, and as soon as the mine is properly opened will erect a mill.

The Whiting Grounds. The above parties have also purchased what is known as the "Whiting Grounds." This is on the same lead with Fricot & Co., and consists of a small claim of 300 feet, lying near the center of Fricot's ground. This is undoubtedly a valuable piece of ground. Work will soon be commenced upon it by the new proprietors.

The Idaho. Next east of Fricot & Co., and an extension of the same, is the "Idaho," owned by Messrs. Findley, Young, Coe and others, comprising 3000 feet on the vein, and extending quite across Wolf Creek, in the direction of Union Hill. This company have sunk a shaft about 40 feet near the creek, and have got the ledge, and an abundance of water, which prevents any further progress, until their steam pump can be put in operation. The company will soon be prepared to commence the work of developments in earnest.

At a point still further east, Mr. Maslin has commenced the sinking of a shaft upon what is undoubtedly a continuation of the same vein. The shaft is now down some forty feet and work was suspended for lack of funds. This company, which is made up of parties in Grass Valley and this city, will do well to go on with the work. Twenty feet more of sinking and a short side drift, perhaps will give them a very good idea of what they have got. The developments on this range are such as to fully warrant the expenditure of a much larger sum than is needed to complete the work indicated.

The next work of importance on this range is that undertaken by Messrs. G. D. Roberts and Henry Burdett, who are opening three parallel veins, on the banks of the creek, but a short distance below the site of the old Union Mill. These veins have been worked to some extent on the surface, and are found to carry much gold. Rich specimens are frequently found, and gold is seen almost everywhere in the rock. A very fine specimen was transfered from the pile to our pocket during the few moments we were examining it, in company with our friend Roberts, one of the proprietors. A tunnel has been commenced which will cut all three of the veins. They lay in a most favorable position for working; and can easily be drained to a great depth by a tunnel.

Union Hill. Beyond this point we came to the Old Union Hill mine, one of the earliest quartz locations in Grass Valley, and one which we first visited in the winter of 1851, at which time they were working a chili mill. But little has been done to this ground since that time, owing to the unpromising appearance of the surface rock. Recent explorations below the water line indicate that the mine will undoubtedly improve in depth. It has recently passed into the hands of Messrs. Findley, McCormick and Roberts, men of capital and energy who will soon put up steam machinery for pumping and hoisting, and proceed to a thorough development of the mine.

Mr. B. B. Layton, whose mill, near this ground, was recently destroyed by fire, is now re-constructing the same, and will soon be ready for crushing again. Mr. L. owns a good lead immediately adjoining his mill. He is one of the pioneer quartz men of Grass Valley, and is certainly deserving of the success which undoubtedly awaits his present enterprise.

The Lucky Company's ground is an entirely new development, and is located directly opposite the old Union Company's ground, and on the opposite side of the creek. Some six or eight hundred tons of rock have already been crushed from this mine, which has averaged about $35 per ton. We saw on Wednesday last, two large cakes of retorted gold at Findley's Banking house, which were worth about $4,500, the result of the previous week's crushing, of about 130 tons. The batteries were not cleaned up. Their contents would add materially to the above yield. The company has still some 400 tons at the mill, and are taking out some twelve tons per day, which quantity they will soon be able to double. This is one of the most important developments which has been made in that vicinity for a long time, and may be classed with the Allison Ranch and Massachusetts Hill, in point of value. The ledge is the largest in Grass Valley, and with a mill on the ground, the rock can be taken out and crushed for less than $10 per ton, with a full force of men constantly employed in drifting ahead with the dead work always necessary in keeping a mine in good working condition. The mine has been opened by two tunnels, one of which has followed the lead about 400 feet, and found it everywhere the same thing. The other is located about 800 feet distant from the first and has just cut the lead, which looks equally as well as in the upper tunnel. This rock averages about $25 per ton over all expenses. The proprietors are all steady, industrious and deserving men, and, their good fortune is a matter of rejoicing to all who know them.

The Merrimac Lead, owned by Findley, Scadden, Roberts & Co., is another important development recently made. It is located about three quarters of a mile north of the range of the mines above described. It was first opened several years ago, but worked only upon the surface, with varying and rather indifferent success, until quite recently, when the proprietors resolved to go deeper and see what they could find there. Their efforts were crowned with success; the rock was found to improve rapidly with depth, and the proprietors immediately set about erecting a mill, which will be in operation in about a month. They are now taking out rock from a depth of 100 feet, and will soon strike the vein in a still lower drift, some 200 feet from the surface, where they expect to find it still richer. Some 1500 tons have already been crushed from this mine, and some of the finest specimens taken out which are often met with. We have examined several fine ones at the banking house of Findley & Co.

We shall speak of some of the older mines of Grass Valley in our next.

Copper in the Sea.—Two French chemists some few years since demonstrated that the ocean obtained a notable portion of silver. Subsequently these and other philosophers have again been at work upon the same subject. They tell us that, calculating the whole ocean, it cannot contain less than two millions of tons of silver in solution. The truth of this statement is verified by experiments tried at various parts of the world—one more famous than the rest by Mr. Field, an English chemist, who lives at Coquimbo, in Chili. The water be analyzed was taken from the Pacific Ocean, and afforded the same result as that which the French chemist obtained from water taken off St. Malo, France, in the English Channel. That the ocean should contain minute portions of every substance of the globe that is soluble in saline water is not surprising; therefore we are, in a measure, prepared for the further discovery that the "old greybeard," ocean, contains also an enormous quantity of copper—a fact recently proved in the laboratory of a London contributor, Mr. Septimus Piesse. The beautiful blue color of portions of the Mediterranean Sea is due, he says, to an ammoniacal salt of copper, while the greenness of other seas is owing to the chloride of copper. The method of extracting silver from the sea is one of simple affinity. Granulated copper being suspended in the "briny waves," any silver salt that is contained therein is decomposed, a portion of the copper is dissolved, and the silver is precipitated thereon, from which it is afterwards parted by the usual means adopted in every laboratory. By a happy analogy, Mr. Piesse separated copper from the sea by the same process. His experiments were performed between the ports of Marseilles, on the French Mediterranean coast, and Nice, in Sardinia. A bag of nails and scrap iron was suspended at the side of the steamer which plies between these places, and after the first voyage (about twelve hours), copper was indicated to be present on the iron. Four separate voyages, however, were made before the bag of iron was removed to the laboratory; then the quantity of copper was found to be so great that much surprise was shown that the presence of this metal had not been previously discovered, especially when the action of sea water on ships' bottoms has long been known.

Dividends.—The Empire Mill & Mining Company have declared a dividend of twenty-five dollars per share, payable on the fifth instant.

The Savage Company have also declared a dividend of seventy-five dollars per share, payable also on the fifth. These dividends would seem to be conclusive evidence of prosperity on the part of those companies.

Science among the Japanese.—M. Von Siebold, the distinguished scientific author, states that the knowledge of the natural sciences amongst the Japanese is much more extensive and profound than is generally supposed. They possess a great many learned treatises thereupon, and an admirable geological map of their island by Buntsjo. They are well acquainted with the systems of European naturalists, and have translations of the more important of their works. They have also a botanical dictionary, in which an account is given of not fewer than 5,300 objects, and is embellished with numerous fine engravings.

Correspondence from Esmeralda.

Aurora, Oct. 25th, 1864.

Editors Press:—You have doubtless been imposed upon by some itinerating ninny, signing himself "J. S. Miller," for upon diligent inquiry, by several citizens of this place, no person of that name has yet been found, besides, whether a resident or an emigrant, he has displayed his lamentable ignorance of the topography of this district, by placing the Juniata claim on Last Chance Hill, whereas it is located on Martinez Hill, fully one mile distant from the leading claims on Last Chance.

He also pronounces Middle Hill the rich one of the district, and places all the claims of Silver Hill upon it, two feats requiring extraordinary strength of imagination and muscle, for if the former is so very rich as to "bring fame and wealth to Esmeralda," there are many who, with their own optics, have failed to see it, and as for the Oxford Beta Tunnel, the Silver Hill, Winnemuca, Esmeralda, Utah, *not Eutaw*, (which by the way never has been superintended by Wm. Davis, as he alleges,) Iowa, Antelope, Young America, and others, are as anybody with a spoonful of brains, that ever visited Aurora, knows are located on Silver Hill. So far as concerns his dirty fling at the Superintendents, who it seems are too clean to meet with his approbation, I can only say that for competency, sobriety and attention to business, they will compare favorably with any other locality, with few exceptions. Upon the whole, the Superintendents seem to give satisfaction to their officers, and the stockholders, and are held in estimation by this community, who regret very much that the Press should unintentionally become the medium of misrepresentation of our interests, by a dirty Miller, that has fluttered around the bright blaze of his own genius, until he has become too blear eyed to see things in their proper light. Justo.

Reward.—As we were evidently "sold" by "J. S. Miller," we offer a *suitable* reward, (and as much of it as he can carry) for his "apprehension and conviction." We thought the aforesaid Miller was a subscriber, but upon "strict search" observe that our patron rejoices in different initials from his.—[Eds. Press.

Sulphur.—This mineral product is the key which opens the door to chemical manufactures. From it we make sulphuric acid (oil of vitriol), and without sulphuric acid many of the largest factories would cease to exist. By its aid we are enabled to produce so many substances, that the bare mention of them would fill quite a large journal. Bleaching, dyeing, soda-making, metal-refining, electro-telegraphing, electro-plating, &c., are primarily indebted to this acid. Many of the most valued medicines could not be made without it, such as ether, calomel, &c. Sulphur being the chief ingredient of gunpowder, modern warfare could not go on comfortably without it. A people that does not possess lucifer matches stands beyond the pale of civilization, yet matches cannot be made without sulphur; not because matches are dipped into melted brimstone before they are "tipped" with the phosphoric composition which ignites them, but because this very material could not be made without the indirect use of sulphur. In England 60,000 tons of sulphur are annually, consumed the most of which is imported from the volcanic regions of Sicily.

Gold Quartz Crushing in Siberia.—The gold mines of Siberia employ 40,000 workmen, producing about 1,500 pounds of, gold, valued at about $15,000,000. The process in use for working were until recently very costly, and the Government mines did not by any means produce the profits which might be expected. It was the same with the private workings. In some parts of Siberia many mines have been given up, because the yield would not cover the expenses. This state of things has for some time past occupied the attention of the Government, but until recently no remedy could be found. Lately however a Russian subject, who has been for several years in California, has introduced new and improved machinery which has so simplified and improved the process of working, both in placer and quartz mines, that the 40,000 workmen are now producing about double the amount of gold formerly realised.

The Hale & Norcross Mine.

The editor of the Virginia City *Union* recently visited the above mentioned claim on the Comstock ledge, and was shown through the works and mine by Chas. L. Peck, the efficient and gentlemanly Superintendent, and furnished by him with all necessary information and complete statistics in regard to the whole institution. The strength and capacity of the Hale & Norcross Mining Company's hoisting and pumping machinery is nearly double that of any works of similar character in Nevada Territory. The size of the main building, containing the machinery and surface of extraction shaft, is 40x72 feet; carpenter's shop, 32x45; boiler house, 21x40; blacksmith shop, 20x30; storeroom, coal house, office and outbuilding of sufficient size to correspond with main building. Hight of main building between posts, 24 feet; hight to top of ventilator or tower, 44 feet. The frame is put up in the most substantial manner with heavy timbers; the roof is formed of double intersecting trasses, equal, if not superior, in strength to any on the Pacific coast of corresponding dimensions, and has been, and will be, of infinite use and benefit in attachment of block and tackle to its staunch girts, when necessary to handle or move any portion of the heavy machinery in different parts of the building. The machinery is driven by two separate engines—one for pumping and the other for hoisting. The pumping engine has a 20-inch cylinder and 4-foot stroke, equal to 100-horse power. The hoisting engine has a 14-inch cylinder, 2½-feet stroke, equal to about 50-horse power. The boilers, of which there are two, are tubular—length of each, 16 feet; diameter, 52 inches, and contain, each, 37 4-inch tubes. They have stop-valves, adjusted so that one or both boilers can be used for either or both engines, thus saving fuel when practicable. The boilers are set in brick masonry; walls, 22 inches in thickness, in the most workmanlike and substantial manner. Connected with them is the usual steam-drum, and a large heater. The pump is of 10-horse power, worked with a bob, spur-wheel and pinion, at the surface, with the help of another bob, at the drainage level, 310 feet below the surface of shaft. The suction is set at a depth of 560 feet in the pump apartment of the shaft. Thus the hight of the column of water raised at present is about 250 feet. All sills, serving as pillar-blocks, engine-beds, foundation for bob, and everything else requiring strength and strain, are securely anchored with heavy iron bolts and straps in solid stone masonry, to a depth of from 10 to 13 feet below the surface. In fact, from the extraction shaft (which is in the front end of the building, throughout to the back end of the same) under the surface, there is almost a solid mass of heavy stone masonry, thus giving the works above a strength and solidity which will withstand the most immense strain and the test of ages. The engine frames are capped neatly with cut granite blocks, 12 inches in thickness, and the weight of the stone masonry underneath this granite, computed by measurement, is 380,000 pounds or 190 tons. The cross timbers, sills, etc., under the other machinery, are bolted down to masonry, with 1¼-inch bolts. The reels are the heaviest and most substantial ever brought to the Territory, weighing nearly 5,000 pounds each. All shafting throughout the entire machinery is made of the best of wrought iron. Distance of reels from extraction shaft is 49 feet; hight of shieves, carrying shaft-rope, 26 feet from surface of shaft. The hoisting frame is built upon an entirely new principle, different from anything of the kind before constructed in this Territory. It is made entirely of light timbers, blocked apart and securely bolted. Its strength in any direction is double that of any on the Pacific coast, constructed with timbers of anything near the same dimensions. Width, 16 feet; hight from surface of extraction shaft, 29 feet. The pump bob is built of heavy timbers, iron-capped, braced and bolted in the same solid manner, and is capable of sustaining 100,000 pounds, with entire safety. The weight of the column of water it is now raising is about eight tons. The pump-rods are seven inches square, joined with double-locked splices, strapped with 6-foot iron straps and bolted with square bolts. We also noticed a neat and secure powder vault, ingeniously contrived and excavated in the high bank at the rear of the main building. Also, inside of the building, supported by the heavy upper girts of the roof, is a large tank or reservoir for the feed pumps of both engines. This reservoir is supplied from the Virginia and Gold Hill Water Co.'s ditch through another reservoir on the hill above the works. The engines and machinery were constructed at Goddard & Co.'s Pacific Foundry, San Francisco; the carpenter work by Isaac F. Thompson; the blacksmith work by Wm. Cornelius; the mason work by Geo. Chatterly & Co.; the erecting and adjusting of machinery by Wm. Smith (present engineer of the works) and James Floyd, all of Virginia, N. T. The main shaft of the mine is 565 feet in depth, and is divided into three compartments, each being four feet square in the clear. The lower level is 545 feet from the top of the shaft, and here considerable bodies of water have been encountered, temporarily impeding the mining operations; 45 feet above this is the 500-foot level, a neat and well curbed air-shaft connecting the two, and creating a fine current of air. In this last mentioned level, at a distance of about 75 feet from the main shaft, the company have just cut through into the outskirts of the great Comstock ledge, and already find some very promising looking ore, and in a short time will probably strike into the main body of the ledge. Their prospects are of the most flattering order. There are four principal levels, from the upper one of which much good pay ore has been taken, but the company are intent upon finding something better. From the bottom of the shaft, by means of the big pump, the water is raised to the 300-foot level, which connects with the North Potosi level, and through which the water is discharged down Six-Mile Cañon. About the works and mine are employed some 35 men, those in the mine working eight-hour shifts, and those above ground twelve-hour shifts. The whole of the machinery and powerful pumping apparatus works with the quietness and regularity of clockwork, and the Hale & Norcross institution generally is ably and well conducted, and is a credit to this or any other country.

Fire, and the Origin of Fire-Works.

Fire-works were not known to antiquity. It is certainly a modern invention. If ever the ancients employed fires at their festivals, it was only for religious purposes.

Fire, in primeval ages, was a symbol of respect, or an instrument of terror. In both these ways God manifested himself to man. In the holy writings he compares himself sometimes to an ardent fire, to display his holiness his purity; sometimes he renders himself visible under the form of a burning bush, to express himself to be as formidable as a devouring fire: again, he rains sulphur; and often, before he speaks, he attracts the attention of the multitude by flashes of lightning.

Fire was worshipped as a divinity by several Idolaters; the Platonists confounded it with the heavens, and considered it as the divine intelligence. Sometimes it is a symbol of majesty. God walked (if we may so express ourselves) with his people, preceded by a pillar of fire; and the monarchs of Asia, according to Herodotus, commanded that such ensigns of their majesty should be carried before them. These fires, according to Quintus Curtius, were considered as holy and eternal, and were carried at the head of their armies on little alters of silver, in the midst of the magi who accompanied them and sang their hymns.

Fire was also a symbol of majesty amongst the Romans; and if it was used by them in their festivals, it was rather employed for the ceremonies of religion than for a peculiar mark of their rejoicings. Fire was always held to be most proper and holy for sacrifices; in this the Pagans imitated the Hebrews. The fire so carefully preserved by the Vestals was probably an imitation of that which fell from heaven on the victim offered by Aaron, and long afterwards religiously kept up by the priests. Servius, one of the seven kings of Rome, commanded a great fire of straw to be kindled in the public place of every town in Italy to consecrate for repose a certain day in seed-time, or sowing.

The Greeks lighted lamps at a certain feast held in honor of Minerva, who gave them oil; of Vulcan, who was the inventor of lamps; and of Prometheus, who had readered them service by the fire which he had stolen from heaven. Another feast to Bacchus was celebrated by a grand nocturnal illumination. In which wine was poured forth profusely to all passengers. A feast in memory of Ceres, who sought so long in the darkness of hell for her daughter, was kept by burning a number of torches.

Great illuminations were made in various other meetings; particularly in the Secular Games, which lasted three whole nights; and so carefully were they kept up, that these nights had no darkness.

In all their rejoicings the ancients indeed used fires, but they were intended merely to burn their sacrifices, and which, as the generality of them were performed at night, the illuminations served to give light to the ceremonies.

Artificial fires were indeed frequently used by them, but not in public rejoicings; like us, they employed them for military purposes; but we use them likewise successfully for our decorations and amusement.

From the latest times of paganism to the early ages of Christianity, we can but rarely quote instances of fire lighted up for other purposes, in a public form, than for the ceremonies of religion; illuminations were made at the baptism of priaces, as a symbol of that life of light in which they were going to enter by faith; or at the tombs of martyrs, to light them during the watchings of the night. All these were abolished from the various abuses they introduced.

We only trace the rise of *feux de joie*, or fire works, given merely for amusing spectacles to delight the eye, to the epoch of the invention of powder and cannon, at the close of the thirteenth century. It was these two inventions, doubtless, whose effects furnished the idea of all those machines and artifices which form the charms of these fires.

To the Florentines and the Sienneze are we indebted not only for the preparation of powder with other ingredients to amuse the eyes, but also for the invention of elevated machines and decorations adapted to augment the pleasure of the spectacle. They began their attempts at the feasts of Saint John the Baptist and the Assumption, on wooden edifices, which they adorned with painted statues, from whose mouth and eyes issued a beautiful fire. Callot has engraven numerous specimens of the pageants, triumphs, and processions, under a great variety of grotesque forms; dragons, swans, eagles, &c., which were built up large enough to carry many persons, while they vomited forth the most amusing fire-work.

This use passed from Florence to Rome, where, at the creation of the popes, they displayed illuminations of handgreaadoes, thrown from the hight of a castle. *Pyrotechnics* from that time have become an art, which, in the degree the inventors have displayed ability in combining the powers of architecture, sculpture, and painting, have produced a number of beautiful effects, which even give pleasure to those who read the descriptions without having beheld them.

History and Use of Butter, and Analysis of Milk.

If you pay a little attention, gentle reader, to what we are about to say, you will be informed that, if not butter, *fat* is, at all events, for some period, if not all of your life, a matter which presses heavily upon your noble soul. You need fat to lubricate the wheels of your business in this world, more particularly when you desire to go ahead. A fat job, or a fat salary, or fat offices, fat subscribers, fat customers, fat pew holders, or a wife with a fat dowry, or a husband with a fat income—in short, *fat* is the object for which you are struggling and striving in this sublunary world.

"Give us this day our daily bread," is only humbly uttered in our daily prayer; but give us our daily bread with *butter*—and a good deal of butter, too—is silently, warmly, and devoutly, the heartfelt wish and the full sense of the prayer. Look and examine even a certain species of sensible men, who make fools of themselves to be considered by greater fools as great men—and why? because they want, besides their daily bread, *butter*, and nothing else. In future, butter is, perhaps, destined to be still more in demand. Let us tell you that a Frenchman invented and patented a process to make from fat or oil, by great heat, an elastic stuff like India rubber, which he calls an "oilic gum elastic." Perhaps some other talented inventor will make this substance transparent, and then it can be used instead of glass or crystal, so that it will not be very wonderful to have a linseed oil or "orange" butter palace. Don't laugh, gentle reader, but remember that there are busts and large columns and windows of soap, and columns and statues of stearine (that is, soft lard hardened by a chemical process,) made in our day.

These, however are only speculations for the future; let us look rather to the past and present of the use of butter, which is interesting enough when we take into consideration that we eat it about three times a day. Milk, no doubt, was one of the first articles of food used by man; and cows, goats, and sheep, were domesticated on that account. It is to be wondered at that butter came so very late into general use. Milk being only a mixed substance of butter, cheese, and whey, it soon curdles, without artificial means, as is well known—the oily parts forcing their way upwards, and forming cream, and as soon as that is going on, the cheesy parts settle on the bottom, the whey remaining in the middle.

As general as is the use of butter now all over the world, the ancients knew but little of it. Chamea, of the Bible, was formerly understood to be butter; but as it is spoken of as a fluid, chamea could no nothing else than cream—so it is confirmed by glossologists. Herodotus mentions that the Scythians used milk of horses, which was tossed by their slaves, and then they found that part on the surface more palatable than that on the bottom. Hypocrates also speaks of this practice of the Scythians. Aristotle alludes to the use of milk and cheese but not to butter. According to Plutarch butter was used to make a salve—which is still the case, as well in Asia as in Africa—which medical application is confirmed by Dioscorides and Galenus.

Butter as food was, however, well known to the Teutons, and Plinius and Tacitus describe their methods of making butter and cheese; and it is very probable that the Greeks learned to use butter from the Scythians, as the Romans from the Teutons. In the South of Europe, olive oil was in more general use, as it is yet in Italy, France, Spain, and Portugal, and butter only for medical purposes. Of course, not much pains were taken to preserve butter, and to make it solid. It was used in a fluid state, and Athenæus calls it milk oil.

Many improvements have been made in this country, in the making of this important article of domestic economy, both in the quality of its yield, and in its color and flavor—the color preferred both here and in England being a rich, golden yellow, while in France and Germany a white, lard-like appearance, with a particular flavor, is demanded.

The importance of the products above noted may be judged, when we state that the whole amount of butter produced in the United Sates in the past year is estimated at five hundred and fourteen millions of pounds, and is valued at eighty-two and three-quarter millions of dollars; while its associate articles of cheese and milk were valued at eight and a quarter millions of dollars for the former, and eleven and a half millions of dollars for the latter—the total amount of cheese produced being estimated at one hundred and seventy-three millions of pounds; of which quantity, forty millions of pounds is estimated to have passed through Albany, N. Y. In addition to the large amount of butter and cheese consumed in this country, they formed an article of export, in 1855, to foreign countries, of the value of about one and a half millions of dollars. The production of butter and cheese is, of course, dependent on the food of the cows, and the consequent richness of the milk—the proportion of the former (both cow and food being of the best quality) being about two hundred pounds, and that of the latter from three hundred and fifty to five hundred pounds annually.

In Europe, Holland and Hungary, Germany, Ireland, and Switzerland, are the largest butter producers.

Analysis of Milk.

Milk	Cream	Butter	3	
		Casein	5

		Sugar of Milk	4	
		Chloride Soda and Potash	½	Salts.
		Bone Earth	½	
		Free Soda	½	

The Rind of Fruit Indigestible.—This applies to all fruit, without exception, and includes also the pellicle or skin of kernels and nuts of all kinds. The edible part of fruit is particularly delicate, and liable to decomposition if exposed to the atmosphere; it is, therefore, a provision of nature to place a strong and impervious coating over it, as a protection against accident, and to prevent insect enemies from destroying the seed within. The skin of all the plum tribe is wonderfully strong, compared with its substance, and resists the action of water and many solvents in a remarkable manner. If not thoroughly masticated before taken into the stomach, the rind of plums is rarely, if ever, dissolved by the gastric juice. In some cases, pieces of it adhere to the coats of the stomach, tho same as wet paper clings to anything, causing sickness and other inconveniences. Dried raisins and currents are particularly included in these remarks, showing the best reasons for placing the fruit upon the chopping-board with the suet in making a pudding of them; for if a dried currant passes into the stomach whole, it is never digested at all. When horses eat oats or beans that have not been through a crushing-mill, much of this food is swallowed whole, and in this state, being perfectly indigestible, the husk or pellicle resisting the power of the stomach, there is so much loss to nutrition. Birds, being destitute of teeth, are provided with the apparatus for grinding their seed, namely, the gizzard, through which the seed passes, and is crushed prior to digestion. The peelings of apples and pears should always be cast away. Oranges we need not mention, as this is always done. Orleans, greengages, damsons, and all plums, should be carefully skinned if eaten raw, and if put into tarts, they should be crushed before cooking. Nuts are as indigestible as we could desire, if the brown skin be not removed or blanched, as almonds are generally treated.

Septimus Piesse.

Beautiful Extract.—When the summer of youth is slowly wasting into the nightfall of age, and the shadows of tho past years grow deeper and deeper, and if life were on its close, it is pleasant to look back through the vista of time upon the sorrows and felicities of years. If we have a home to shelter and hearts to rejoice with us, and friends have been gathered together by our firesides, then the rough places of our wayfaring will have been worn and smoothed away in the twilight of life, while the sunny spots we have passed through will grow brighter and more beautiful. Happy, indeed, are those whose intercourse with the world has not changed the tone of their holier feelings, or broken those musical chords of the heart whose vibrations are so melodious, so touching in the evening of age.

City Stock Reports---San Francisco Stock and Exchange Board.

From the "Weekly Stock Circular" of the Associated Brokers.

San Francisco, Saturday Morning, Nov. 5th, 1864.

Transactions at the Board this week have been confined to some leading stocks and a few speculative shares. Nearly all first-class stocks have improved, and are well sustained at the advance. The aggregate yield of these mines for the past month proves to be larger than was anticipated, and is regarded as a favorable augury for the future. Developments continue to be flattering, and at no former period during the last six months have a number of claims on the Comstock given such tangible evidences of value. Of Gold Hill proper, and also of ground south of this locality, reliable Washoe advices speak enthusiastically, and some predict a handsome revenue from these mines for a long time to come. Speculative shares have been dealt in, at variable rates, since Saturday last.

The receipts of bullion from the interior and northern coast during the past ten days have been unusually large and exceed *twenty-three hundred thousand dollars*. This is a gratifying exhibit, and shows the unabated productiveness and value of the leading interest of the people of this coast.

Savage has been inactive, but advanced from $1,900 to $1,975, buyer 30, and was held at the close at $1,950. A dividend of $75 per foot will be disbursed to the stockholders, to-day, for the month of October. A considerable surplus remains to the credit of the company after the payment of this dividend. The mine is said to be looking very well.

Gould & Curry declined from $1,620 to $1,405, rallied to $1,450, receded to $1,400, seller's option 30 days, and closed at $1,435 bid, $1,440 asked. A dividend of $50 per foot is payable to-day ont of the net earnings of the past month. 35 feet have changed hands.

Chollar rose to $1,100, buyer 30 days, receded to $1,000, and was sold yesterday at $1,100, buyer 30. Sixteen feet were sold at these rates. The actual yield of the mine for the month of October exeeeds $115,000, which, when received, will cancel all the liabilities of the eompany, and enable them to henceforth apply their net revenne to a dividend fund. The product of this claim for the current month will, it is thought, be largely augmented. The lode in the south mine continues to increase in length as its development progresses, and some good ore has been met with in the fifth level of the north mine.

Yellow Jacket has been in good request and steadily advanced from $865 to $1,050, buyers option, and closing at about $1,000. Large sales were made, and 35 feet changed hands. The present condition of this mine is represented as being quite promising. A large body of pay metal has been disclosed recently. Second class ores are averaging about $60 per ton, and the debt of the company will be materially curtailed the ensuing month.

Crown Point advanced to $660 per foot and sales have been reported "between boards" at $750. The yield of this claim for October amounted to $25,000 and, after the disbursement of considerable sums for the exigencies of the winter, a surplus balance of some $6,000 remains at the credit of the company. A transfer office has been opened on Wall street for the benefit of Eastern parties, who now hold one fifth of this stock. The lode at a depth of 200 feet shows three distinct pay veins, from six to twelve feet in thickness. The Crown Point and the Marysville Mills are crushing some 20 tons of ore per day.

Hale & Norcross has been actively dealt in and 50 feet were sold receding from $545 to $525, advancing to $560, and selling yesterday at $540. In drifting from the 500 feet level, promising ore has been found and it is thought that further to the southeast a heavy and concentrated body of metal will be reached.

Ophir has also been largely dealt in, 73 feet changing hands; opening at $430, declining to $400, advancing to $420 and closing at $418. The new mill is at work about half of the time, owing to a lack of water (its full capacity is 20 tons per day,) and is reducing ore which yields about $45 per ton. The company have some 2000 tons of this class of ore on hand at their mine, are out of debt, with a surplus in Bank of about $12,000.

Best & Belcher has revived again and eight shares were sold at $300 per foot.

Uncle Sam declined from $220 to $190 and $180, at which rates 10 shares were sold, and Overman rose from $150 to $165, and declined to $145, some 70 feet changing hands. Our previous statement respecting the consolidation of these two companies was substantially correct.

Imperial has met with but trifling sales at $155 and $157 per share. The receipts of bullion from this claim for the month of October amounted to $88,500. After the payment of the dividend of $7½ per share a surplus of $12,000 will remain in the treasury. Mr. P. S. Buckminster has been appointed Superintendent of the Company. The Rock Point mill is now running 40 stamps and will employ 16 additional on the 10th inst. The introduction of steam power will, it is believed, obviate any further difficulty from low water in the Carson. Outside mills are to be dispensed with next week.

Burning Moscow has been subjected to violent fluctuations and was actively dealt in. Some 3000 shares have changed hands, declining steadily from $58 to $20 and selling at the close at about $35. Recent advices are said to be less favorable.

Bullion declined from $155 buyer 30, to $143, rose to $160 buyers option, and sold yesterday at $140. Some 280 shares were sold within this range.

Nevada (J. G.) declined from $32 to $27½, seller 30, but has since risen to $31@32. One hundred and sixty-five shares were sold at these rates.

Sierra Nevada declined from $65 to $47½; Real del Monte from $28½ to $23, and Antelope from $80 to $70.

Sheba rose to $75, buyer 30, and closed at about $53. A shipment of some $4,000 was received this week from the mine.

Wide West fell from $27 to $25 and rose to $26. The absence of water is interfering with the operations of the mill. Utah was sold at $12½.

Josephine (Coso) was sold to the extent of 430 shares, at from $4½ to $6, closing at $5½. The financial prospects of this company are assuming a more satisfactory shape.

Burnside was sold at $5@5½; Bajazet & Golden Era at $16@17; Buckeye at $6¼; Caledonia Tunnel, $9½@10; Green (G. H.) at $8.

The aggregate sales of stock since Saturday last amonnt to $386,120

Authorized Scale of Commissions Adopted by the S. F. Stock and Exchange Board.

Miscellaneous.

Funded Debt, on par	½ per cent
Insurance Stocks, on par	½ per cent
Wharf Stocks, on par	½ per cent
Gas Stocks, on par	½ per cent
Railroad Stocks, on par	½ per cent
Steamboat Co. Stocks, on par	½ per cent
Telegraph Co. Stocks, on par	½ per cent
Water Co. Stocks, on par	½ per cent
Legal Tender Notes and Bonds, on par	½ per cent
Bills of Exchange, on net amount	½ per cent
Mint Certificates, on net amount	½ per cent
Specie, on net amount	½ per cent

FRANK LAWTON, Secretary.

Commissions on Mining Shares.

Sale at 1 dollar up to 10 dollars	$0 25 per foot
Sale at 10 dollars up to 25 dollars	50 per foot
Sale at 25 dollars up to 50 dollars	1 00 per foot
Sale at 50 dollars up to 100 dollars	1 50 per foot
Sale at 100 dollars up to 200 dollars	2 50 per foot
Sale at 200 dollars up to 400 dollars	5 00 per foot
Sale at 400 dollars up to 600 dollars	6 00 per foot
Sale at 600 dollars up to 800 dollars	7 50 per foot

From $800 to $3,000 per foot, one per cent, on the amount of purchase or sale.

Anything above $3,000 per foot, three-quarters of one per cent. on the amount of purchase or sale.

J. B. E. CAVALLIER, President.

[Written for the Mining and Scientific Press.]

Ione Correspondence.

EDS. PRESS:—By way of posting you as to the geographie position of the locality whence I write, I may say this town is the county seat of Nye county, and that Nye county lies in the southeastern corner of Nevada, and embraces in its limits a very extensive tract of country. We are distant from Austin about fifty miles in a south-southwest direction, and about seventy miles due east from Walker's Lake. To reach here from California the best route is to come through Carson, and along the overland road to Middle Gate, where you turn off to the south, and come in over Whitehill's toll road. From Carson City the distance by that route is about 150 miles. Considering there is a good deal of desert to cross, the road is not a bad one. There are several dry, sandy stretches, and but little grass along it, making it a pretty hard route for teams, especially in the summer. For bringing in goods, we pay ten cents per pound from Sacramento, being at the rate of $200 per ton. Earlier in the season the prices were higher, as they will be from this on. Next year we look for them to be lower, as the roads are to be shortened and improved. We get a portion of our supplies, such as flour, bacon, &c., from Salt Lake, freights being less from there than from California. Most kinds of provisions are cheap, considering the cost of getting them here. On an average, it is hardly more expensive living here than in Virginia. More than two thirds of the people who were here last spring are now gone, leaving not over two or three hundred in the county. After the election some of these will depart, and I don't think more than a couple of hundred will stop here through the winter. Many people will come here in the spring, as our mines are rich. The ledges, like those at Austin, are narrow, with a small but very rich pay streak. The ore above the line of permanent water is of the bromide and chloride kinds; below, the sulphureted ruby ores are found, some of which are seventy per cent. silver, selected samples working from one to two dollars per pound. The only means here for working the ores are hand mortars and a small three-stamp horse mill, with which fair wages are made, men averaging three or four dollars per day with a mortar, and the horse mill of course doing much better. Another horse mill is now being built, and several will be under way before spring. The advantages of these mills are, that they cost but little, work the ore thoroughly, and school all classes to the business. A five-stamp steam mill is also to be built here, forthwith; the parties having the business in hand being on the ground. One or two others of like capacity are talked of, and will be put up in the spring, if not before. Mills can be run here *cheap*, the best of wood costing less than three dollars per cord, delivered where wanted, and there being no lack of water.

The ledges are numerous in this district; some being large and others small; the latter are the richest. Some of the large are good, too, yielding rock that works up well under the stamps. At Grantsville, ten miles south, are ledges with six feet of pay rock that go $400 to the ton, by working process. This is on the surface; whether it is to grow better or worse further down, is a problem yet to be solved. A great many ledges here have had a little work done on them, the object being to do just enough to hold them; on others shafts have been sunk two hundred feet or more, showing as good a prospect as the rich mines at Austin. Over a thousand tons of pay rock have been raised from these prospecting shafts, part of which has been sold on the ground at fifty dollars a ton; a large lot crushed at Austin is reported to have yielded over three hundred dollars per ton. If it did, then this district must soon make a noise, as there is a good deal of that kind of ore here. The small ledges are from six to fourteen inches wide on top, generally increasing in width as they go down.

If the mines turn out well, this will be a thrifty country as it contains nearly everything required for working the ores cheaply. Besides wood and water, there is salt close by, of which a great deal is needed, and which becomes a costly article when hauled from a distance. Bunch grass grows here everywhere, and in many spots grain and vegetables can be grown successfully. The climate is healthful and pleasant, and not subject to the extremes that mark that of California; its worst feature is unseasonable frosts that kill the more tender garden plants before they reach maturity. The winters are not severe, being neither excessively cold nor stormy. The soil is naturally rich and productive, and with the aid of irrigation will bring good crops of grain; with proper tillage, much of it would do so without this artificial stimulus. Its fertility is shown by the grass and other wild herbage growing upon it, of which there is abundant quantities. The forests, which consist of scrubby pitch pine with a sprinkling of mahogany and juniper, are confined to the mountains, there being no trees in the valleys. From the pine, which grows to a good size hereabouts, a tolerable article of lumber is made, and for the purposes of fuel it is not surpassed. H. D.

Ione, Nye County, N. T., Oct. 26th.

Temperature of the Body.

It is truly said that few, if any, ordinary buildings, whether dwellings, shops or factories, are so constructed as to preserve exactly the same temperature in every apartment, and at all seasons. And as for heating themselves, and preserving a uniform temperature, by the very employments or manufactures which are going on within them, nobody probably ever heard of such a thing. A self-heating house! Why it would excite as much astonishment as would a machine which should really have the power of perpetual motion.

And yet "the house I live in" has this power, wonderful as it is, of not only heating itself by the process of generating and purifying blood, concerning which I have treated at length, and by other curious processes, but also of regulating the heat, and keeping it at the same point, with scarcely any perceptible variation.

The heat of the human body is never far from ninety-eight degrees of Fahrenheit's thermometer. By this we mean, that if you were to plunge the bulb of the thermometer, containing the mercury or quicksilver, into the flesh of the body, or even hold it in your mouth, the mercury would rise in the tube till it got to about ninety-eight degrees, and there remains.

Infants, except when just born, have a temperature of only about ninety-four degrees. The heat increases, as we advance towards maturity, after which it remains nearly stationary at about ninety-eight degrees, until we begin to decline, when it slightly diminishes. In the spring and the beginning of summer, it increases a little, in persons of every age; but declines again towards winter. When a person is greatly enfeebled by sickness or otherwise, it is slightly diminished. In fevers and inflammatory diseases it sometimes increases to one hundred and four, and even to one hundred and seven degrees.

But I have not told you how this steady temperature of ninety-eight degrees is kept up in the human system. Indeed I cannot do it, for I do not know the cause. I have already told you that the evaporation of the matter of perspiration on our skins has some effect in keeping us cool; but this cannot be the sole cause why men can remain with impunity in places heated to a greater temperature than boiling heat. There must be other causes not yet fully understood.

As to the reason why we retain so high a degree of heat as ninety-eight degrees, when the temperature of the atmosphere is almost always far below that, there have been a great many speculations—guesses—by philosophers; but they have, generally, been mere guesses. The process of digestion, the formation of chyle, the change of chyle into blood, and the change of the blood in the lungs—especially the latter—are all believed to have a part in the work. Yet they do not, by their united efforts, accomplish one half of it; and it remains for future anatomists and physiologists to investigate the subject more deeply. Some suppose that electricity, or galvanism, or perhaps an agent much more subtle still, has something to do in the matter.

Perspiration always modifies the heat of the human body more or less, and is one means of keeping us cool. The reason is, that the moisture on the surface of our bodies evaporates; and this produces cold. It is said that you may almost freeze a man in midsummer, by keeping him wet with ether; so rapidly does the ether evaporate.

How far the laws of the great Creator may ultimately be discovered in this, as well as in a thousand other things of which we are yet ignorant, it is not easy for us, in the present infancy of human knowledge, to conjecture.—*Dr. Trall.*

MISTS.—The formation of mists never takes place if the temperature of the water be lower than that of the atmosphere; but when the cold air above the land mixes with the warmer above the water, mist or fog will be the result, which will be so much the greater in quantity as the land surrounding the water is higher and deeper. It is by the deposition of water from the atmosphere, through the operation of this law, that the mountains and plains in hot climates are covered with verdure and fertility.

MINERAL SPRINGS.—We have often had occasion to express our sentiments with regard to the impure waters called "medicinal," or "mineral springs." The people have been so miseducated that they regard poison and medicine as synonymous terms, and imagine that, if any pool or stream can be found whose waters are so adulterated or impregnated with earthy, alkaline, saline or mineral ingredients, that they are not fit to drink, so impure, indeed, that no one would think of using them for cooking purposes, it must of necessity be a grand article to swallow for remedial purposes. There never was a more irrational and absurd practice invented than that of running after sulphur, iodine, iron, and other drugged waters for health purposes. Yet the custom prevails all over the civilized world, and many persons who call themselves Hydropathic physicians, (would they were Hygienic physicians, also,) locate their "cures" at the fashionable watering places, or near some "mineral spring" whose waters are recommended to their patients, while the same drugs that are held in solution in these waters, if taken directly from the drug shop and administered in powder by allopathic physicians, would be condemned by these "water-doctors" as poisons. This is a distinction without a difference. Along the banks of the Mississippi, just below the Falls of St. Anthony, and some half-dozen blocks distant from our "Western Hygeian Home," are several springs which are strongly impregnated with iron and sulphur. They have a slightly acid, a strongly astringent, and a moderately sulphurous taste, very much as a compound of iron rust, rotten eggs, and half-decayed cabbage might be imagined to taste. They are much resorted to by the invalids who throng this country and who stop at the hotels and boarding-houses in the vicinity. We are of opinion that a majority of them get more damage from these waters than they get benefit from the pure atmosphere, and so they return home worse than they came, of course calling Minnesota a delusion and the climate a humbug.—*Dr. Trall's Herald of Health.*

INGENUITY OF THE GERMANS.—The following are some of the inventions generally credited to natives of Germany, and also the times when made known:—

"Saw mills in 850; sun dials in 898; fulling mills in 996; windmills and oil paintings, in 1100; spectacles in 1270; paper of linen rags in 1300; organs in 1312; gunpowder and cannons in 1318; hats in 1330; wire making in 1350; pins in 1379; grist mills in 1389; wood engraving in 1436; printing in 1436; printing presses in 1439; copperplate engraving and printing ink in 1440; cast types in 1442; chiming of bells in 1487; watches, letter posts or mails, reeling and bolting apparatus, in 1500; gun locks in 1527; spinning wheels in 1535; almanacs, sealing-wax and stoves in 1546; telescopes in 1590; wooden bellows in 1610; microscopes in 1620; thermometers in 1638; mezzotint engraving in 1643; air pumps in 1650; electric machines in 1651; pendulum clocks in 1665; clarionets in 1690; white china ware in 1706; Prussian blue in 1707; stereotypes in 1709; mercurial thermometers in 1715; pianofortes in 1717; solar microscopes in 1736; the gamut in 1753; lithography in 1783."

THE SHADOWS WE CAST.—In this great world of sunshine and shadow, we are constantly casting shadows on those around us, and receiving shadows from them in return. There is no pathway in life which is not sometimes in the shade, and there is no one who walks over these paths, it matters not which way they tend, who does not, now and then, cast his shadow with the rest. How often do we, by a mere thoughtless word or careless act, cast a shadow on some heart which is longing for sunlight. How often does the husband, by a cold greeting, cast a gloom over the happy, trusting face of his young wife, it may be, has waited anxiously for the first sound of his footsteps to give a joyous welcome to his home. How often has the parent, by a harsh reproof, chilled the ever-flowing spring of confidence and love which is bubbling up from the fountains of the heart of the innocent prattler at his knee. How often are the bright rays of hope torn from the clinging grasp of the souls of those worn out by poverty and the never-ending conflict of life, by the stinging ridicule or the sordid avarice of those whom the world honors—aye, loves to honor. How often does the child—even after it has grown to the full bloom of manhood, and is clad in garments of strength and beauty—bring sorrow to the parent already tottering on the brink of eternity. Then beware, lest you cast a deeper shadow over those which are already darkening his happiness. The shadows we cast—can we escape them? Can we look back, as we walk on in life's journey, and see no shadowy marks about our footprints?—*Home Monthly.*

THE consumption of wines has gone down nearly forty per cent. in this country, and the consumption of cigars one-half, since the heavy taxes have been imposed upon these articles of luxury.

WHY DO NATIONS DIE?—The question has often presented itself to historians, why do nations die? Is mortality a condition of their existence, or is it but accident? Reasoning from analogy may be multiplied abundantly on both sides of the question. But as regards the facts of history, there is one case, and only one, albeit a very weighty one, which can be quoted in opposition to the theory that nations as well as individuals must die. The case is that of China, where, from the earliest times of which we have any knowledge, a people has gone on increasing in numbers, and maintaining its national existence down to the present day; and of which we may truly say that although it is possible to imagine a time when that empire may be directed by Europeans, it surpasses any ordinary imagination to conceive of that vast population, numbering one-third of the whole human race, becoming extinct or ceasing to be Chinese. So far as facts go, China furnishes a strong argument against the doctrine of national mortality. But for this one old nation that has lived and still lives, there are half a dozen others which have perished. The Babylonians and the Assyrians are dead and gone; not a single living trace of them exists. The national existence of the ancient Egyptians passed away (we may say) 1,600 years ago. The Greek nation ceased to exist long ago; and its blood has become so mixed, and its country so changed, that if it should revive again it will rather be as a new people than as a continuation of its former existence. The Romans were but a tribe—their empire was that of a polity rather than of a people; and both polity and people have disappeared. In the New World the mortality of nations has been still more strikingly displayed. The Mayans of Central America, the old Peruvians, the Toltecs and Aztecs of Mexico, have ceased to exist; and even the barbarous nomades are melting away before the advance of the new-comers from Europe.

WHERE MOSQUITOS COME FROM.—These pests of summer proceed from the animalcules commonly termed the "wiggletail." If a bowl of water is placed in the summer's sun for a few days, a number of "wiggletails" will be visible, and they will continue in size till they reach three-sixteenths of an inch in length, remaining longer at the surface as they approach maturity, as if seeming to live on influences derived from the two elements of air and water; finally they will assume a chrysalis form, and by an increased specific gravity sink to the bottom of the bowl. A few hours only will elapse when a short black furze or hair will grow out on every side of each, till it assumes the form of a minute caterpillar. Its specific gravity being thus counteracted, it will readily float to the surface, and be wafted to the side of the bowl by the slightest breath of air. In a short time a fly will be hatched and escape, leaving its tiny house upon the surface of the water.

Any one who has had a cistern in the yard has doubtless observed the same effect, every summer, although he may be ignorant of the beautiful and simple process of development. If a pitcher or cistern or other water containing these animalcules is placed in a close room over night, from which all mosquitoes have been previously excluded, enough mosquitoes will breed from it during the night to give any satisfactory amount of trouble. In fact, standing by a shallow, half stagnant pool on a midsummer's day, the full development of any number of "wiggletails" to the mosquito state can be witnessed, and the origin of these disturbers of night's slumbers thus fully ascertained.

MATHEMATICS.—Mathematics is the most noble and elevated science the human mind can investigate or study. Each question that the student undertakes to solve, when accomplished, but leads to another and a higher, and thus leads the intellect to consider and grapple with the grandest realizations of truth in our universe. All other sciences (except those relating to living beings) are based upon it. Astronomy, its eldest child, and Mechanics, its most useful servant, are but practical mathematics. How grand and noble to calculate the distance of stars, the motions of the planets, and to prophecy the appearance of a meteor! and how useful and glorious, as advancing true civilization to calculate the horse-power of a steam engine, to estimate the extent of a bed of coal, or to determine the practical strength of iron! All these are done by the aid of this science, and the world teems with objects for its investigation.

TIN PLATES.—Tin plates—that is, tin plates of iron dipped into molten tin, which covers the iron completely—are manufactured in South Wales and Staffordshire, to the extent now of about 900,000 boxes annually, equal to 56,000 tons, and valued at over five millions of dollars. In England, almost every article of tinware is formed from these plates. Nearly two-thirds of the total manufacture are exported to the United States.

It is Impossible for editors to know ALL the merits and demerits of their correspondence, consequently the reader must not receive the opinions of our contributors as our own. Intelligent discussion is invited upon all sides and the evidence of any error which may appear will be received in friendship and treated with respect.

American and Foreign Patents.—Letters Patent for inventors can secured in the United States and foreign countries through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past year.

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the MINING AND SCIENTIFIC PRESS, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

San Francisco:
Saturday Morning, Nov. 5, 1864.

CALIFORNIA MINING INTERESTS.

The mining stock disturbances of the past year will long be remembered by Californians, not only for their positive and direct influence upon the general industry of our people, but also for their collateral and consequential influences in bringing back the public mind to a true appreciation of the real and substantial interest of the immense mineral sources of our own State. The result will be, and undoubtedly is, highly beneficial to the community at large, although exceedingly disastrous to an unfortunate few. The chaff will be—even now is—pretty well sifted from the wheat, and the difference between mere mining stock in the market, and the mineral wealth of the earth exposed to the sunlight by the practical science of the miner is now known and most sensibly felt.

Stock in mines, mills, and mining equipments and appliances, that has been scattered broadcast over the State, and particularly in this city, is now chiefly valuable as assets in inventories, in the hands of assignees, or as a remembrance of the hard earned money which has gone out of the pockets of industrious citizens to fill those of speculators. This sifting process, which is still in operation, will result in scattering to the winds the worthless chaff while that which is really valuable will fall into the hands of practical men, who fully understand what they are about, and who will make the most of it for their own benefit, and thereby indirectly advance the general interests and industry of the entire community. In this process new combinations will be formed; excrescences will be lopped off; mining energies and capital will be better directed, and the losses and bitter experience of the past will thus be made to lead to results, alike profitable to the capitalist, creditable to the science of mining, conducive to the positive wealth of the country, and tending to a proper and economic development of the great leading industry of the Pacific coast.

No man who has looked carefully and intelligently into the cause and condition of the present depression of our mining interests sees therein anything to discourage or dishearten us as to the final result in their ultimate value. The conclusions which we have briefly stated above must be potent to every observing and intelligent mind. Our recent personal observations in Grass Valley and vicinity has but confirmed us in the above conclusions. Intelligence which reaches us from other parts of our widely extended mining region, but adds to that confirmation. So far as California is concerned one important result of the late mining mania will be to draw back again from distant sections many who have left old established mining camps, to seek their fortunes in new and untried localities. As winter approaches, and with it the necessity of a permanent location, these roving prospectors are coming back by thousands to their former places of abode and labor, fully convinced that notwithstanding the acknowledged richness of other localities, California, by the ready access of capital, cheapness of living, geniality of climate and its homelike associations and surroundings is after all the best place in which to look for a permanent home, and affords the surest and most reliable returns for both labor and capital.

As a community we owe much to our pioneers who go out into distant regions to discover and develop new mining localities, to increase the bounds of knowledge and to introduce us to new fields of enterprise for the occupation of labor and the investment of capital. But in the restlessness and pushing energy of our people, we are liable to be too superficial in our efforts, to devote our attention too generally to prospecting, and neglect the ultimate necessity, of thoroughly developing our work as we progress. Our community as a whole, is too much like many individual miners, who make prospecting their only business, obtain possession of a large number of claims, but never develop any. They count their wealth by thousands, yet pay for their daily bread with borrowed money. How much better would it be if they would concentrate their efforts on one or two claims, and thoroughly develope as they go. This disposition to possess ourselves of new territory at the expense of a neglect to develop that already in our possession, is what has caused the present stock depression. There is not floating capital enough in the entire Union to develop the four or five thousand company locations that have been made during the past two years Of course a large proportion of these locations are partly wildcat; and but a small proportion of the balance will ever be developed into paying claims. A large proportion of the money that has gone over the mountains the past two years has been expended in *watching* rather than *working* the mines, and awaiting for customers, with money, to come along and purchase. Thousands have thus purchased to their sorrow.

The sifting process now going on will soon determine how many of all these claims possess a value. The money now being expended is mostly applied in a legitimate manner, and with judgment. The beneficial effects of such a curtailment of prospecting operation is already apparent. Mining as a speculation is pretty much done with. The beneficial effects of this change may be seen forcibly illustrated in Grass Valley, which one year ago was nearly depopulated by a general stampede of its population on prospecting explorations, mostly to the neighboring territory. A few—a very few—have been successful. The multitude, has been loser. They are now at their old homes again, and have gone to work, with a will, to further develop the mines at home. The success of such efforts is already apparent, in the renewed industrial appearance of the town, and the feeling is almost universal there, that prospecting, except as an incidental pursuit is, to use a common parlence, "played out." Such we are assured is the case in numerous other mining localities.

Californians and, indeed, miners everywhere on the Pacific coast have yet much to learn. One important lesson has just been forced home upon us by the cogent power of experience, and others are yet to be learned. At no period in our history, have so many interests been thrown together requiring experience, careful discrimination and the most critical acumen in developing, managing and concentrating those interests as at the present time. We shall endeavor, so far as we are able, to lend a helping hand in this process of renovation. We shall be dilligent in our efforts to collect information of practical value to the miner, and do all in our power to give notoriety to newly discovered mineral localities and resources, when we are satisfied of their value; but we shall not knowingly give prominence to any mine or mining company in our columns, which we may have room to believe has been got up for speculative purposes, or that cannot present evidences of value other than mere paper ones

---

TWENTY-SEVEN ladies of New Bedford, Massachusetts, have agreed to furnish each a representative recruit.

MINING IN GRASS VALLEY.

A flying visit, the past week, to Grass Valley, enabled us to take a look at the mines and mining operations in that important mining locality. An absence of two years from our former home, covering, as it had, a period of unusual depression in the mining interests of California, had wrought no important change in the general appearance of the town. Six months ago that town was probably witnessing the lowest state of depression which it has ever experienced. Since that period, however, the returning tide of emigration has set in, and at the present time the town presents a wonderful degree of activity. The industrial enterprise which has thus returned, has manifested itself by taking a new hold of the inexorable resources of the place and the result has been most gratifying, and in some cases, already highly remunerative. Operators in quartz, whether at the mill or mine, are now working with increased energy, and a more free expenditure of capital is now being witnessed there than at any previous period. Several old workings that have long been abandoned, have recently been re-opened, and new developments are in progress, while several are already in the full tide of most successful accomplishment. A new and bright day has, in fact, dawned upon legitimate mining, not only in Grass Valley, but in the entire State, as well, and many are rejoicing at its advent, and in the cheering and hopeful prospect for the future, which is so closely revealed. Capitalists, who for a long time have regarded the quartz business of this place as a mere receptable for the absorption of their money, are now beginning to look favorably upon the resources of the locality, and are continually seeking for opportunities to invest. Joseph Woodworth, formerly of Grass Valley, but more recently of this city and of Ophir notoriety, has recently purchased one of the oldest mines there, and is now erecting extensive machinery, devised upon a somewhat novel plan, but which has been pretty thoroughly proved by extensive experiments. The quartz is to be crushed dry upon a plan recently patented by Messrs. Wheeler & Hotalling of this city, and amalgamated by aid of Superheated Steam, employed in Ryerson's amalgamator. The practical result of the use of this machinery on a large scale is an interesting problem which Mr. Woodworth will soon solve, and which we shall lay before our readers at the earliest moment, with a detailed description of the same. Mr. Coe, President of the Imperial company, of Gold Hill, Mr. Davis of the Ophir company, Mr. A. E. Head, Mr. Robert Merrill and several other successful Washoe operators, have recently made important purchases of valuable leads near Grass Valley, which they are preparing to work on an extensive scale. Messrs. Fricot, Roberts, Findley and other capitalists of this place are also investing largely in new enterprises.

The chief point of interest, just at this time, is a section of ground about half a mile in width and running from the old Day diggings, on the Nevada road, to Union Hill, some two and a half miles distant in a southerly direction. Portions of this ground were among the earliest worked quartz mines in Grass Valley, but were long ago abandoned or neglected for lack of enterprise, or a desire to *prospect* in distant portions of the country. We have elsewhere alluded more particularly to the individual operations along this line, which we fully believe will eventually rival the famous Comstock range of Washoe in value and productiveness.

The only fear is that the natural impulsiveness of our Grass Valley friends may lead to extremes. Mining, above all other kinds of business, requires profound judgment and deliberation. Operations to be successful must be carried on with the greatest care. One very important feature connected with the mines of Grass Valley is that with scarcely an exception thus far, the veins have decidedly improved as they have been worked downward. There is now connected with the business in that place, a universal feeling of permanent interest permanent residence and prosperity. There appears to be a permanency connected with the appearance of the mining interests in that place, which is no where else excelled or perhaps equalled. This idea is kept up in the durable character of their places of business, the comfortable and homelike appearance of the dwellings, the presence of numerous churches, the existence of schools and newspapers, and in fact of all the advantages and opportunities which we have left in our former homes at the East.

But little has been done at placer mining in Grass Valley during the past year, in consequence of the scarcity of water. Indeed but little more is expected to be done in that direction, except by Chinamen, into whose hands nearly all the placer mines have already passed. We have no means of ascertaining the amount of capital invested in the quartz business; but the number of mills now in operation is ten, and seven more are in progress of erection. The mills in operation are capable of reducing about nine hundred tons of quartz every twenty-four hours. The amount of gold now being taken out in Grass Valley is not far from $250,000 a month. This amount will soon be largely increased by the starting of new mills. The mills are all under the direction of competent and prudent managers, and the companies owning other mills and mines generally consist of three or four individuals only. The cumbrous machinery of incorporated bodies is unknown there and the cost of maintaining them is placed to the account of profit.

SAWDUST BLASTING POWDER.

We made some allusion, a few weeks since, to a new explosive compound, which has recently been invented, the basis of which is common sawdust. This sawdust is chemically prepared, much after the manner of gun cotton. The process of manufacture is extremely simple and cheap, and the material, when ready for use cannot be fired by mere friction, an objection which is said to exist against the use of gun cotton, at least under its ordinary manufacture. This prepared sawdust may be rubbed with any degree of violence, upon the floor, beneath the boot with perfect safety. It has been tried to a considerable extent for blasting in Grass Valley, where it is manufactured, and has been found to work equally as well as the best blasting powder. It has also been found to work as well as powder when used in the small cannons employed for firing salutes in that place. It can be furnished at much less cost, and is much safer to handle and transport than ordinary gun powder. It is used bulk for bulk, with powder, although its weight is one half less, another important advantage in distant inland transportation. It can moreover be made at any point where sawdust can be obtained, the transportation of the chemicals being but a trifle. It has been used by the Messrs. Watt & Co., on Massachusetts Hill, by the Allison Ranch Company, and at the Forest Spring and Ophir mines in Grass Valley. It has also been used at San Juan. Some 40 kegs have been used for blasting in the cement diggings at "You Bet." All the parties who have used it state that it works full as well as ordinary blasting powder. The parties who have the patent right are still experimenting in its manufacture, which they have already improved upon to some extent. When their experiments are fully completed they will commence its manufacture on a large scale. We see no reason why this invention should not prove one of much importance to California and the world at large, as well.

TO EXTRACT GREASE FROM CLOTH.—The cheapest and most effectual preparation for extracting grease from cloth, may be made of one part of liquid ammonia and four parts alcohol mixed with an equal quantity of water. If kept on hand it should be placed in a glass-stoppered bottle. Apply with a piece of sponge, soaking the cloth thoroughly when the grease has remained any considerable time in the fabric.

S. F. Mechanics' Fair Reports.

COMMITTEE REPORTS

OF THE SAN FRANCISCO MECHANICS' INSTITUTE INDUSTRIAL EXHIBITION OF 1864.

[By authority of the Executive Committee for the management of the Fourth Industrial Exhibition of the Mechanics' Institute, we shall continue, under this heading, until completed, the publication of the Reports and Awards of the Examining Committees in the various departments of the Exhibition, as revised by the Managers to accord with the rules governing the distribution of awards. Where the reports have not been made in form prepared for publication, abstracts or digests only will be given. The Managers desire it stated that, while articles originating and manufactured abroad contributed in a degree to the variety and interest of the exhibition, which in return afforded their merits opportunities of becoming widely known, to the advantage of those showing them, the enterprise was intended to be an exposition of the material and industrial resources of this State, and the adjacent Territories, to which the honorary awards must be limited. Believing, too, that the distribution of premiums of several grades among competitors has a greater tendency to produce jealousy and dissatisfaction than to encourage enterprise and efforts for excellence, the Executive Board has determined to allow no second, third, or other inferior grade of Premiums.]

Classes V and VI.

Iron Smith Work, Stoves and Hardware.

SUB-DIVISION I.—SAFES AND SAFE LOCKS.

COMMITTEE:

THOS. A. AUDERLIN, FRED. MARET, WM. HARTMANN.

Report:

Three of our home manufactures of Safes compete for awards in this department.

JONATHAN KITTRENGE—Steel Plated "Monitor" Burglar Proof Safes, which are built and finished in the most massive and thorough manner, and may safely defy either the bar, hammer, chisel or drill of the burglar. Premium.

J. WEICHART exhibits a Fire Proof Safe of superior workmanship and quality, entitling it to a Premium.

SAMUEL JONES exhibits a Fire-Proof Safe, of quality and workmanship deserving honorable mention.

JOSEPH BIEN exhibits a Combination Lock, showing both skillful workmanship and ingenuity, which entitle him to a Premium.

RUSSELL ERWIN CO. have for exhibition (and not for competition) several of the well known Lillie's Fire and Burglar Proof Safes.

W. F. ENSIGN likewise has one of Lillie's "Monitor" Bank Safes.

E. C. HALL & CO. exhibit a case of Re cut Files, representing a branch of industry which saves thousands annually on the importation of files. Premium.

C. R. RICK exhibits some fine samples of Horse Shoes. Entitled to honorable mention.

MCFARLANE & FLINN exhibit two Horse Hoofs, showing the structure of foot and manner of shoeing. The cure shows in the preparation of the hoofs and skill shown in the shoeing, deserve honorable mention.

J. W. QUICK has two Perforated Iron Screens, which deserve honorable mention.

SUB-DIVISION II.—MOULDING CUTTERS AND PLANE IRONS.

COMMITTEE:

SAMUEL WILLIAMS, GEORGE ROBINSON, JAS. HATCH.

Report:

N. W. SPALDING and J. WEICHART are the only exhibitors of home-manufactured Moulding and Plane Irons, and the articles presented by each, in form and finish, are certainly not excelled, if equalled, by any imported, while in temper and wearing qualities the testimony is entirely in their favor. As between these competitors Mr. Spaulding has the largest variety of moulding cutters and some fine samples of steel-faced machine plane irons, which do him a great deal of credit; but for the finest finished and best moulding cutters the committee award to Mr. Weichart the Premium.

SUB-DIVISION III.—STOVES, TIN AND HARDWARE.

COMMITTEE:

J. DE LA MONTANYA, GEORGE A. SNOOK, E. H. BRYAN.

Report:

The Committee of Examination in this department recommend the following awards:—

JOHNSTON & REAY, for best drawing Chimney Top, Premium.

OSGOOD & STETSON, for Plain Tin Ware, Premium.

J. O. WRIGHT, for Window Hinge, in frame, Premium.

A. C. DEXTER, for two Lever Door Gongs, Premium.

CALLAGHERE & WEEN, for Brass Sheathing Nails, Premium.

G. M. WOOD, for Name Stencil Plates, Premium.

TAY, BROOKS & BACKUS, for "Monitor" Stove, Japanned Tin Ware, Copper Ware and Pressed Ware, Premium.

The highly finished and beautifully ornamented Japanned Ware of TAY, BROOKS & BACKUS, comprising Water and Wine Coolers, Tea Caddies, Sponge and Hip Baths, Pails, Coal Hods, Powder Flasks, etc., together with Planished Copper, Pressed Tinware and Wrought Iron Stoves, etc., formed a feature in the Exhibition worthy of special mention as affording evidence of successful enterprise in a branch of industry requiring not only capital, well-directed mechanical labor and skill, but also expensive artistic manipulation; and nothing is hazarded in saying that these goods may safely challenge comparison with any from the Eastern States or Europe, either as to substantial quality, style of ornamental finish or price.

Class VII.

Gold Pens, Jewelry, Hair Braiding for Jewelry, Seal Engraving.

SUB-DIVISION I.—GOLD PENS.

COMMITTEE:

W. L. D. BUNNE, E. P. HEALD.

Report:

The committee in this department report—"That after a long, careful and thorough trial, both as to mechanical construction and adaptation to the wants of the writing public, they find, first, more compass of the nib; second, more flexibility; third, more support from the iridium point; fourth, a finer ink split in the point (the absolutely requisite qualities for good writing) in the gold pens of Mr. W. B. J. Kenney than in any others on exhibition." He is therefore entitled to the Premium.

SUB-DIVISION II.—JEWELRY AND HAIR BRAIDING FOR JEWELRY.

COMMITTEE:

E. F. OHM, T. GROS, LUCIUS THOMPSON.

Report:

The jewelry department in the Exhibition is very limited.

JOSEPH BROS. have a case containing Ladies' Waist Buckles and a fine statuette, "Agriculture," in silver.

A. MENDOZA has a well made Ladies' Waist Buckle, provided with a novel and ingenious spring fastening.

MR. BOHM is adjudged by the committee entitled to the premium on the Waist Buckles exhibited in the case of Joseph Brothers.

A. SOHNIN is entitled to credit for a fine exhibition of French Clocks and Bronze Statuettes.

There are four exhibitors of hair work for jewelry.

C. F. FISHER has some good specimens of hand-braided Watch Chains.

MRS. USZYNSKI has a small case of very well and tastefully wrought samples.

Miss BALDWIN, of Marysville, has a case containing a great variety of this description of work, showing a very high degree of excellence both in design and execution.

But the committee, after a very careful examination, award to Mr. and Mrs. Schmidt, for the best work of this class, the Premium.

SUB-DIVISION III.—SEAL ENGRAVING.

S. GENOT is the only exhibitor of Seal and Letter Stamp Engraving, and the excellence of the specimens shown entitle him to a Premium.

Class IX.

Cutlery, Surgical Instruments, Dentistry, Dental Apparatus.

SUB-DIVISION I—CUTLERY.

COMMITTEE.

WARD EATON, J. W. MCKENZIE, A. F. SAWYER.

Report.

The Committee appointed to examine the California Manufactured Cutlery, at the Industrial Exhibition of the Mechanics' Institute, held at San Francisco, September, 1864, have carefully inspected the different specimens, and beg leave to make the following report, viz:

A Superior Case of Cutlery, by M. Price, of this city, consisting of a great variety of Razors, Carving Knives and Forks, Bowie Knives, Hunting Knives, etc., all of his own manufacture, are to be seen in every shape, showing the progress of manufacture from the rough bar of steel to the highly finished blade, fully equal to any ever imported. We cheerfully pronounce the above case entitled to the first Premium.

A beautiful Case of Cutlery of great variety, made by Messrs. Will & Fink, of this city, all of very excellent workmanship, among the articles in this case are pricking knives, pruning knives, barbors' shears, cork-screws, conductors' forceps, faro box and machine for cutting cards, some of which are fully equal to any on exhibition; and we earnestly recommend for them a special premium.

Your Committee would particularly request, also, that Mr. Kesmodel of this city receive a special premium for that branch of cutlery, surgical instruments of his own manufacture, and highly creditable, as also a pruning knife of his own make and of peculiar style, claimed as his own invention.

All of which is respectfully submitted.

SUB-DIVISION II—DENTISTRY AND DENTAL MATERIALS.

COMMITTEE.

R. COLE, CHAS. E. BLAKE, H. AUSTIN.

Report.

Dr. H. J. Paine, San Francisco, exhibits several artificial dentures on vulcanized rubber, and gold, the former good, the latter superior, and deserving a Premium.

Dr. Q. L. Adams, San Francisco, artificial teeth on gold and vulcanized rubber—the latter the most perfectly constructed of any on exhibition with that material and deserving a Premium.

Dr. Beers & Co., San Francisco, Artificial Dentures on gold, vulcanite, and porcelain. That on gold exhibited at former fairs; the rubber work good. The porcelain plate and gum present a good appearance, but the teeth are defective in not shading necessary to a clear imitation of nature. These dentures have some qualities to recommend them in preference to any others, but the impossibility of a perfect adaptation to the mouth, and their liability to break, must ever prove a great objection to their general use.

Dr. E. F. Bunnell, San Francisco, upper set of artificial teeth on rubber, very fair; also, upper set on gold plate and teeth attached with vulcanized rubber. The superiority of this kind of work over entire rubber plates is very much questioned.

Dr. John Heald, San Francisco, several pieces artificial teeth set on gold and rubber; also artificial teeth imported.

Dr. William Calvert, San Francisco, exhibits a good variety of artificial teeth superior to any before manufactured in the State, and are deserving the special attention of the profession. Also, corundum wheels which appear to be superior. In view of their excellent quality, and the fact that the exhibitor has entered into competition with eastern manufacturers of great repute in the production of these articles, so extensively imported, he is awarded a special Premium.

SUB DIVISION III—DENTAL APPARATUS.

COMMITTEE,

J. D. STAONG, C. SCHENK.

Report.

The Committee on apparatus for extracting teeth, beg leave to report, that,

We found but a single article on exhibition, and that was the invention of Mr. Oudry of Pennsylvania, exhibited here by Dr. E. Belle, of San Francisco. It consists of a box, containing a freezing mixture; another surrounding it filled with a fluid called chloride of calcium, and used in this case because it takes a low degree of temperature without congealing; four gutta percha tubes, through which this fluid is pumped to and from two little pads, while they are in contact with the tooth, and a thermometer by which to regulate the degree of cold. The object attained by this apparatus is the chilling and numbing of the nerves of the tooth to be extracted, by applying to it a degree of cold nearly as low as the freezing point, thereby rendering that part of the mouth insensible to pain. The effect produced is precisely similar to the numbing of the fingers which follows their exposure to a low degree of temperature in a cold climate; and is equally harmless and no more unpleasant.

We have given minute attention to the principles on which this apparatus is constructed, and have also examined carefully its practical workings, and we believe it to be a very important invention, simple, practicable, safe, and destined to supersede all other methods of extracting teeth and performing surgical operations without pain.

Class X.

Musical Instruments.

SUB-DIVISION I.—PIANOS.

COMMITTEE:

GEORGE T. EVANS, J. CARNAUD.

Report:

JACOB ZECH and FREDERICK ZECH each exhibit two Pianos, of fine quality and finish.

The instruments of FREDERICK ZECH we find on trial to be admirable in some qualities but unequal in others.

JACOB ZECH'S Pianos are found preferable in fullness of tone and durable qualities. He is, consequently, entitled to the Premium.

SUB-DIVISION II.—FLUTINAS AND ACCORDEONS.

COMMITTEE:

GEO. H. COES, FRANK MEDINA, MARTIN SIMONSEN.

Report:

The Flutinas and Accordeons manufactured and exhibited by C. C. KRENE are superior to any we have ever seen, and he is justly entitled to the first premium for the State of California.

SUB-DIVISION III.—BANJOS.

COMMITTEE:

D. A. THINN, FRANK MEDINA, G. H. COES.

Report:

The Banjo exhibited by E. S. TURKINGTON was a creditable piece of elegant workmanship; but we find, on careful examination, that the Banjos made and exhibited by CHARLES MORRELL are the finest toned and the best instruments for practical use. In our opinion Mr. Morrell is entitled to the Premium.

SUB-DIVISION IV.—FLUTES AND CLARIONETS.

COMMITTEE:

GEORG EKOPPIZ, J. CANAUD, FRANK MEDINA.

Report:

Having examined the Flutes and Clarionets manufactured in this city by Mr. GEORGE PAPE, we do not hesitate to say we have never seen like instruments of equally good workmanship, and in all the qualities required they are perfect. Premium.

SUB-DIVISION V.—GUITARS.

M. Y. Ferrer reports that he has examined the Guitar made by D. MOJICA, and finds it admirable in fineness and durability of tone and a tastefully made instrument, meriting a Premium.

Class XI.

Furniture, Billiard Tables, Upholstery.

SUB-DIVISION I.—CABINET WORK.

COMMITTEE:

W. P. TAYLOR, C. RICHTER, JAMES ROSS.

Report:

The exhibition of Cabinet Work in Furniture and Billiard Balls was extensive and very creditable.

A. HUMBURG, EASTON BROS., A. CONRAD, VICTOR CAPPE, C. H. FUHR, C. ANDREWS, GOODWIN & CO., H. EULER and B. P. MOORE exhibit Furniture of handsome pattern and good workmanship.

M. E. HUGHES, P. LIESENFELT, J. DROULHIAT, JACOB STRAUBE and — ECKHART exhibit Billiard Tables of choice material and elegant finish.

The duty of determining to which the preference should be given where each could claim excellence in some particulars, and all had merit, was difficult and embarrassing; but after most careful inspection we award the Premium for skillful workmanship in Cabinet Furniture to EASTON BROS.

And for the best Cabinet Work on Billiard Tables, JACOB STRAHLE is entitled to the Premium.

SUB-DIVISION II.—UPHOLSTERY.

COMMITTEE:

JOS. ACKERMAN, E. BLEGMANN, PHILIPPE NEPPERT.

Report:

Restricted to the award of one premium only, the committee on Upholstery Work find, after a careful examination, the best work in this line on a Sprung Back Iron Chair, exhibited by GOODWIN & CO., and that firm is therefore entitled to the Premium.

SUB-DIVISION III.—PLAYING QUALITIES OF BILLIARD TABLES.

ALFRED MOULIN, Chairman Committee.

Report:

The committee of five chosen by the competitors report, through the Chairman, Alfred Moulin, that they met by appointment in full committee, tried one of the Tables of M. E. HUGHES, one of P. LIESENFELT'S, one of J. DROULHAT'S, one of J. STRAUBE'S and the Table of — ECKHART, but were so divided in opinion upon the respective merits of the Tables tried, that they were unable to determine by a majority of the committee to which the award should be made.

SUB-DIVISION IV.—BILLIARD BALLS.

COMMITTEE:

M. F. BUTLER, JOS. LITTLE.

Report:

J. G. H. MEYER is the only exhibitor of Billiard Balls. We have carefully examined the Balls turned by Mr. Meyer, and for perfect truthfulness and beauty of execution in coloring and otherwise, we have never seen them surpassed by the imported article, and we take pleasure in awarding to him the Premium.

Class XII.

[Carriages and Wagons.

COMMITTEE:

R. S. ELLIS, E. G. WOODSIDE, H. M. SHULTE.

Report:

The committee appointed by the exhibitors of Carriages at the Industrial Fair report:—

That we have made a careful examination of all the vehicles of California manufacture offered at the Fair, and find scarcely any competition, each exhibitor showing his particular class or style of work, which is peculiarly his own. The show of fine workmanship, however, is very creditable to our California carriage makers, and they can safely challenge any of the celebrated Eastern manufacturers to excel this show of fine work, either for style, durability, or neat workmanship. We can recommend that the following persons or manufacturers be awarded such premiums as your honorable body may see fit to present:—

To POLLARD & MOORE, for an Extension-Top Barouche, showing extraordinary workmanship in iron work, also in trimming, and the whole vehicle an elegant and creditable piece of workmanship.

To A. SEARLS & Co., for a Brett Carriage (Central Park style), light and elegant in its proportions, and showing California manufacturers are not to be outdone in manufacturing stylish and comfortable vehicles.

To G. P. KIMBALL & Co., for a Family Carriage, of more than usual merit for genteel style and workmanship, not excelled by any manufacturer on the Pacific coast and by few of the oldest and best manufacturers in the Atlantic States.

To W. R. BROWN, for three Sun or Cloth Top Buggies, New York styles, which for light buggies cannot be surpassed for elegance of proportions, style and workmanship in the United States.

To A. SEARLS & Co., for one Sun-Top and three Leather Top Buggies, styles peculiarly their own, very "natty," and particularly worthy of notice, exhibiting originality as a manufacturer and exquisite workmanship.

To G. P. KIMBALL & Co., for a "Park Phaeton" and open no-top Buggy, both vehicles showing workmanship of a high order, alike creditable to themselves and this Exhibition.

To M. P. HOLMES, for a neat Side-spring Concord Style Top Buggy, in all its proportions and workmanship—a good serviceable vehicle.

To SPRUNG & MCARRON, for an open or no top Concord Style Buggy, unfurnished, not trimmed nor painted. This vehicle presents extra workmanship, both in wood and iron, and is deserving of examination by our mechanics.

To E. C. BROOKS, who exhibits a new style Buggy, with combination springs of rubber and steel, with compound levers. Quite a novel and ingenious invention.

To M. CURTIS, for an Express Wagon, of good proportions, skillful workmanship and fine finish.

To MCLAUGHLIN & FESSEL, for a good Lumber or Farm Wagon.

To A. M. ELLIS, for a Child's Chaise, of skillful workmanship and proportions.

To G. P. KIMBALL & Co., for model of Patent Coupling Truck; a very useful invention.

To W. R. BROWN, for a Butcher Cart, made and finished in a thorough and workmanlike manner.

To BATH & MORRISON, for an unfurnished (not painted nor trimmed) Butcher Cart—a very carefully made and workmanlike job.

To E. G. WOODSIDE, for new style of Thoroughbrace Coach or Carriage Spring, adding to the old style thoroughbrace India rubber springs at each end, by which greater spring will be attained, consequently more ease to passengers and less strain on the vehicle.

In making an examination we find that the best show of workmanship is exhibited in the Extension-Top Barouche made by POLLARD & MOORE, and that they are entitled to the first premium.

Class XIII.

Carving and Gilding.

COMMITTEE:

S. C. BUGBEE, SAML. M. BROOKS, EDW. C. POWERS.

Report:

Having been appointed a committee to examine the specimens of Carving and Gilding on exhibition at the Fair, we would respectfully report:—

Carving.—The works exhibited by Mr. W. B. GLEASON (a Quail, Dove and Hawk's Feather in wood), we consider the best exquisite specimens of that art we have ever seen in any country, and he is entitled to the highest award.

The Carved Flowers, by Messrs. BRYANT & STRAHAN, are very finely done and in bold relief.

Gilding.—We consider Messrs. WOOLL & SUTHERLAND entitled to the highest award for a very fine ornamental Gilt Frame of Table.

The specimens of Gilding by Messrs. NILS & KOLLMEYER, also by Miss LEKENS, are fine, and deserve notice.

Class XVI.

SUB-DIVISION II.

Woolen Goods, Etc.

COMMITTEE:

A. AUSTIN, SIEGMUND HERMAN,
C. H. HARRISON, M. M. NOAH.

Report:

We the undersigned, appointed a committee to award premiums on Woolen Goods, would most respectfully submit a brief report of what has come to our knowledge in reference to woolen manufactures, in our opinion the most important branch of industry which has ever been undertaken in our State.

California owes much to the enterprise and energy of the gentlemen who have brought this important industrial feature to such perfection that it is impossible to import goods of the same grade and sell them in competition, our home-made goods being superior in fineness of material and in general finish. During the past year both mills have extended their capacities for the manufacture of cloths for general use and produced cloth for military and civic wear, which is very good in quality, finish and harmony of coloring, and much better adapted for the climate of the Pacific coast than the imported article.

It also affords us much pleasure to call attention to another branch of equal importance—viz: manufacturing carpets, lately inaugurated by the Mission Mills, which exhibits an article of what is known as "the Ingrain," and equal to imported in design and coloring. The State of California and the surrounding Territories being only equalled by Australia for wool growing, this fact, with the well known energy and the ample means of the present proprietors of the woolen mills, is a guarantee that this branch of industry is yet destined to be a very important feature in the commercial progress of our State.

We also take an opportunity of stating that the woolen manufacturing interests are deserving of every protection and encouragement, and are well worthy of the fostering care of our Legislature in offering inducements in the way of premiums for the best manufactured articles of their various fabrics. By so doing they would create a worthy rivalry, besides encouraging improvements in manufactures, benefitting the community at large.

It is also worthy of remark that every article made by either of the mills is all wool, imported goods of similar grade very often, if not always, being mixed with cotton in more or less quantity.

With these few remarks we will, before informing you of the awards, state on what grounds our conclusions were arrived at. We were told that a representative of each mill had classed together the same grade of goods of their respective factories, but we were not advised of the prices asked by either mill for the goods shown us. We are, therefore, in ignorance whether the articles awarded the first premiums are sold for the same price, or higher or lower. By this we desire that you should understand that our decisions are only applicable to the quality of the fabric presented us, and can in no way be considered a decision in favor of one mill more than another as a factory. We are inclined to the belief that with the same materials the one factory can do as well as the other, and we further believe that no test can be made unless the same material is known to be used by each mill, and such being known, the mill that can make the best and sell the cheapest is the one entitled to the first premium. Now as no such course has been followed, we can only award the first premium for the qualifications mentioned—viz: that of which of the two mills has the best articles on exhibition, and which we do as follows:—

Blankets—Washoe, Mission Mills; Sinice, do.; India, Pioneer Mills; Family: three grades were exhibited by each mill, the award for each was given to the Mission Mills.

In Flannels, three classes were exhibited—viz: White, gray and red, and awarded as follows:—White, Mission Mills; Red, do.; Gray, Pioneer Mills.

In the exhibit of Cloths, which was very creditable and beyond our expectations, and would do honor to any European market, the award was given to the Mission Mills. Military Cloth, dark and light blue, awarded to the Mission Mills.

The Mission Mills are also entitled to the award for the most extensive and varied assortment of goods.

In the opinion of your committee, the Mission Mills are also entitled to a special and marked premium for the carpet exhibited by them, although no competition was made.

Your committee would also award a special premium to the Pioneer Mills for their manufacture of undershirts and drawers, although no competition was made.

Although the Mission Mills received the largest number of awards, your committee would be derelict did they not unite in making commendable and favorable mention of the different articles from the Pioneer Mills, and would recommend that the Mechanics' Institute, in its future Fairs, should stipulate that woolen goods offered for competition shall be taken from the stocks on sale of each factory.

All of which is most respectfully submitted.

HOME FINANCES.

The money market is substantially unchanged, and no pressure was observable on steamer day, in mercantile circles, or among general borrowers. The business community are not requiring much accommodation at this juncture, and meet with no difficulty in obtaining all the facilities needed. Good mercantile paper is somewhat scarce, and is now rarely seen except in the portfolio of the banker. The supply of money is increasing steadily, and the evident tendency of the market is to greater ease. The capital of some of the foreign banking institutions recently established here has been at their credit in the East for some time past, and is now drawn for. This is therefore an absolute addition to the available means of the community, and will exert a beneficial influence. An impression prevails in certain quarters that the rate of interest will fall to one per cent. before the 1st of January, if no disturbing element should manifest itself meanwhile and all the material interests of the country remain in a prosperous a condition as at present.

The receipts of treasure from the interior and north coast since Saturday have been unusually large, and amounted to some $2,000,000. Of this sum $400,000 was taken by the Branch Mint, $600,000 went to China, and $1,000,000 was shipped per the Golden City to New York and England. The demand for bullion for shipping purposes was fair, on Thursday, at about 845 for gold bars, and from one per cent premium to two and a half per cent discount for silver.

Currency bills on the Atlantic were sold on steamer day at 110@112½ per cent premium on gold. Telegraphic Transfers were offered at five per cent premium, and drafts payable in coin at 3@3½, although it is contended that no profit is made by the seller at these rates. Sterling is selling at 48½@49*d* for bankers'. Legal Tender Notes have dropped to 45½@46 per cent.

EASTERN FINANCES.

The overland mail brings Eastern market advices to the 10th ult. Political affairs and the military situation were exerting a material influence in commercial and financial circles, contributing still further to unsettle all values, and to demoralize the general trade. At the above date all classes seem to be curtailing their liabilities, and were striving to realize upon stocks of merchandise and other property, in view of the expected decline in gold. A panic had prevailed, and many parties were, it was thought, acting with impatient haste and an utter want of discretion. Leading mercantile houses, in the dry goods trade, had marked down a large portion of their stock twenty to thirty per cent; but even at this decline there seemed to less demand than there had been at higher rates. Gold had fallen, during the first ten days in October, to 180, and rallied to 192 @195, but there was no confidence felt in the stability of the market, and it was therefore deemed the part of prudence to prepare for the inevitable crash which was supposed to await them in the future.

The causes of the depression, which we have alluded to before, are not fictitious or transitory, and with such a state of affairs it is well that business men have the sagacity to meet the exigencies of the time by careful preparation. From the tenor of our Eastern exchanges an unusually sluggish fall trade is anticipated. The victories of our armies and the progress of an exciting Presidential campaign, conspire to disturb the public mind, and to divert the attention of business men, more or less, from the details of trade and commerce.

Returned.—Mr. Henry S. Brooks, of the Triunfo Mining Company, has returned from the works of the company on the Peninsula, bringing a good report thereof. Some sample bars of bullion, which he brought from the mine, can be seen at Keany & Alexander's, Montgomery street.

New Mining Advertisements.—Stockholders are referred to notices published under this head in our advertising pages.

Letter from the North.—Lumber Mills, Etc.

Fort Madison, Oct. 13th, 1864.

Editors Mining Press:—Since the mines at Sooke have proved a failure, and the interest thereby seriously abated, I resolved to take a trip up Puget Sound, one of the most remarkable inland seas, both for its physical grandeur and importance to trade, that may be found upon the coast. The extent of the ship navigation, extends from the mouth of Fuca straits to Olympia, where vessels of the largest class may ride with perfect safety and penetrate into every little estuary which characterizes this sound, and through which the productions of the country may find a pass to market to all parts of the world. Taking the weekly mail steamer from Victoria, we made Port Angelos, directly across the straits, distance ten miles. This is the only port of entry on the sound, where all vessels from foreign ports must enter and clear. It has no other significance than as the residence of the collector of customs; and it is located behind a spit, which sweeps gracefully up the coast for the distance of five miles. Our baggage having undergone inspection we were at liberty to move on unmolested. A few miles further along, enclosed in a semi-circular spit, is New Dangeness. Here is a steam saw mill, which embodies the whole interest of the town. A few miles further on, up an estuary of deep soundings, is Port Discovery, a place also extensively engaged in the lumber trade. Our second stopping place was at Port Townsend, formerly the port of entry. It is a thrifty looking place, has several fine buildings and a masonic hall, all of which impressed me with its prosperity. It is sustained more by the agricultural interest by which it is surrounded, than by the chief staple of manufacture, which will ever be the characteristic feature among the many thriving towns on the sound.

Port Ludlow is noted for its lumber trade exclusively. It is a few miles beyond Port Townsend, and adjoining is the military reserve, where several white buildings may be seen, but which now, to use a naval expression, are laid up "in ordinary," or in other words, not in use. I was informed that behind the reserve is an open prairie, containing some fine farming lands and improvements. Port Gamble our next stopping place, is also a large lumber manufacturing town, and is held exclusively by Messrs. Pope & Talbott, of San Francisco, who do a large business in that trade. In connection with the mill they own several large vessels, employed in the trade, and out of the seven awaiting their turn to load, one was bound to Adelaide, one to Valparaiso; the balance to San Francisco. Twenty-three miles from Port Gamble, by water, is Port Madison, situated on an Island and sheltered within a small cove, almost land locked. This place is owned by Messrs. Meigs & Gawley, whose office is at the foot of Market street, San Francisco. It is exclusively a lumber manufacturing town. The firm own, on the Island, 6,000 acres of timber land and are erecting on the ruins of their old mill, burned down in June last, a commodious mill, which, when complete in all its apartments, will be the best mill on this coast, or, indeed, I may say, of any other. It is 330 feet long, 75 feet wide, and two stories high. They have it already enclosed with a roof and are running one large circular, and are fitting up other machinery, including Edger's gang saws, planing and lath mills. In connection is a machine shop and foundry, where all sorts of machinery can be turned out, and, although they seek not for custom work, nevertheless they do a little of that class for courtesy. The U. S. Steamer Shubrick, stationed on the sound, recently put in there for repairs to her machinery, and had it been necessary she could find her machinery over hauled as completely, perhaps, as in San Francisco. The whole management of this concern, so far as the working appointments are concerned, is under the control of the able superintendent, Mr. Wm. Coleman, whose ingenious and constructive talents are duly appreciated by the firm, as well as the community in which he resides. It is astonishing with what clock-like precision every department is carried on, bleading into one great whole the master spirit and element of success. This order is also a marked feature in the social relations of the company towards their workmen, in consequence of which they have drawn around them a highly respectable class of mechanics with their families, so unlike the trash too often found in large lumber districts. As the firm own and control the soil, an ardent spirits or gambling is allowed about the place. As an intellectual desideratum a large library is organized, a school established, and the masonic fraternity has a well organized and successful existence. A well regulated hotel, upon strictly temperance principles, where the traveller can find the comforts of home, is no small item, wherever we may wander, and here it may be found. In connection with the mill, this firm own six first class ships engaged in the trade, together with a large steam propeller used to tow log rafts to the mill. Upon the whole I don't know when I have been better entertained, than in this well regulated and social community, during a residence of three weeks. D.

Another Exposure.—A lengthy description of the disgusting and rascally thieving transactions of Moses Frank, President of the Utah Mining Company, living in San Francisco, and the Superintendent, Baum, residing at Aurora, has been brought to light by the publication of their private letters. The manner in which villains can steal, in conducting mining operations, before the eyes of their Trustees, is astonishingly well illustrated. Frank is under arrest, and should he made to take a long sweat for his dastardly villainy. There are more of his tribe still in position who will bear watching. The work of purification in mining business, we are happy to see, continues. The good results will surely follow. Smoke away, we say, and bring out the lazy, thieving swine—root, branch, hoofs and all.

Correspondence.—Our "Ione Correspondence" is from a well known and reliable author. Some very interesting facts and much information concerning lumbering improvements will be found in our well presented communication "From the North." Of the article concerning "Our Iron Clad Navy," we cannot speak too highly, and we desire to hear from our New York friend regularly.

Owens River Canal Company.—We have received a prospectus of this company, which was recently issued in New York. The President, Mr. R. S. Whigham, is now in that city presenting the interests of the company to Eastern capitalists, and we hope he will succeed in gaining their money and influence for carrying out the plans of their grand undertaking.

The State of Nevada.—The announcement that the President had given his signature for the admission of Nevada Territory, as the thirty-sixth State of the Union, was joyfully received on the 31st of October.

We owe our Nevada county cotemporaries acknowledgments for kind notices of our senior partner, which we would give our readers but for his extreme modesty in such matters. He has not returned yet.

Nitrate of Soda.—It is said that watering strawberries with water in which *nitrate of soda* has been dissolved, to the amount of one ounce of soda to a gallon of water, will help the plants to produce a wonderful crop.

Illegal Advertising!

We notice many Secretaries are having their notices of delinquent sales published *weekly* in a *daily* paper. As this is a plain violation of the new law we feel it our duty to warn such parties of this error, and herewith append that section of the "Act Concerning Assessments upon the Stock of Corporations," which governs the publication of delinquent notices.

Section 9. Said notice, when published in a daily or weekly paper, or in both, shall be published as follows: When published in a daily paper, the same shall be published for a period of ten days, excluding Sundays and holidays, previous to the day of sale. When published in a weekly paper, the same shall be published for two weeks previous to the day of sale, the first publication in the weekly being at least fourteen days prior to the day of sale.

By the above extract it will be clearly seen that no delinquent stock can be legally sold by advertising in a daily paper, unless the notice is inserted *daily*.

Reports of the Exhibition.—Owing to the omission of exhibitors of certain classes to elect committees of award, the Executive Committee of the Institute, at its meeting of Oct. 27th, authorized the President to select a special committee to act in the premises and report upon articles thus inadvertently omitted from the several reports. The report of this special committee, together with a general report of the Executive Committee, will appear in due time.

Advertising Circular.

The Proprietors of the Mining and Scientific Press would call the especial attention of Mining Secretaries, Trustees and Shareholders, to a few substantial reasons for the publication of Mining Notices in their journal—the first and only important newspaper of its class published upon this coast.

1st. The Press enjoys a large and permanent subscription list, having a more universal circulation among shareholders and men intimately connected with mining interests than any other publication.

2d. Under the present law the publication of all mining notices on Saturday, in a weekly journal, complies as fully with the statutes as a daily publication. It is generally found to be equally as convenient for secretaries, and decidedly preferable to stockholders who have not time to examine throughout every issue of a daily.

3d. Economy in mining should always be looked upon with favor, and the cost for weekly advertising in the Press is less by one half than the rates of any other journal in this city possessing a respectable circulation.

4th. The publishers of the Press, making the mining interest their especial care, take particular pains to assist in the avoidance of errors in advertising. Our print is also more clear and perfect than can be expected in such papers as are hurriedly issued from cylinder presses.

5th. Our "Shareholders' Directory" forms a complete index of all mining notices published in San Francisco, by reference to which shareholders can at once see if their company is advertised, and determine whether the same is inserted in the Press or some other paper.

6th. Many copies of the Press are bound by prominent professional men, mechanics, secretaries, brokers, shareholders and others, as an important record for future reference, thereby rendering advertising, of every class, in its columns, of peculiar and permanent value.

7th. The benefit of having all mining notices consolidated in one newspaper, for the common convenience of shareholders, secretaries, and others who have occasion to refer to the same, is obvious. With this view we have established our rates at only fair, living prices, believing that a journal like ours, untrammeled by party, creed, or prejudice, is the only medium which can reasonably ask for such a consolidation of mining patronage.

8th. Our rates are uniform as well as moderate. Advertisements will be taken from the forms and printed on slips or as circulars, for sending personal notification to stockholders, whenever desired, at $1 per hundred.

9th. Advertisements in the columns of the Press, after their first insertion, are arranged alphabetically. Our present list is equalled only in one instance by that of any other journal. Shareholders, as well as strangers, naturally turn their attention to a mining journal for information concerning the mines and mining matters.

10th. Blanks for filling out advertisements of assessments or notices of sale are furnished gratis. Our rates of advertising, and any other information desired, will be freely given upon application at the office.

Last, but not Least.—Our sheet (having been recently enlarged to the size of Harpers' Weekly) is now only equalled in its dimensions by one mining paper in existence—the *London Mining Journal*. Published in this, the greatest mining field of the world, we desire that the Press shall have no superior. We can only realize our cherished object of building up a reliable advocate of the science and business of mining, which will be of just honor and profit to our community, by experience and liberal patronage. The bestowal of such favors only as naturally belong to us, and which it is clearly for the benefit of the mining fraternity to extend, is all that is requisite, and we are confident we shall receive it.

DEWEY & CO.,
Publishers of the Mining and Scientific Press, Nos. 56 & 57 Government House, Corner of Washington and Sansome streets, San Francisco.

Mining Companies and others connected with the Mining Interests of California, will find all possible desired information in the *Mining and Scientific Press* of San Francisco, which is an ably edited Journal, smartly headed, and well up to the times. The Mining Companies of California, are awake to the advantages of having their Mining Notices, comprising Assessments, Dividends, Elections, &c., concentrated in the advertising columns of one Journal, as we notice in the issue of the *Press* of May 7th, there are no less than seven pages of this interesting matter.—*U. S. Mining Journal, Railroad and Financial Advertiser, New York.*

Important to Secretaries.

Secretaries will please write proper names and figures distinctly, and hand in their advertisements as early in the week as practicable. Our latest forms go to press Friday evening. Any information concerning the requirements of the laws regarding advertisements will be cheerfully given when solicited. Inspect all your notices carefully upon their first appearance. In case of postponement, give the earliest notice possible at the office. When copy is received sufficiently early, a proof-sheet will be furnished if desired. A revised copy rendered, for advertising at the mine, when requested. Neatly printed copies of advertisements, for serving individual notice to stockholders, printed at $1 per hundred. Copies of the new advertising law, as officially published, furnished gratuitously. ☞ Blank forms, for filling out Assessment Notices and Delinquent Sales, supplied free to advertisers in the Mining and Scientific Press on application at the office

[The mining community begin to appreciate our reasonable rates of advertising, and are turning their patronage to the journal most properly entitled to receive it. The advantage to shareholders of having all mining notices concentrated in one mining journal, is obvious to all, and our terms have been established with a view to effect such a consolidation; and most companies having an object for publishing in any other particular paper, can consequently afford to have their notices appear in our journal also.—Eds. Press.

Postponements and Alterations.—Secretaries are requested to give notice of postponements, or alteration, which they may desire made in their advertisements, at their earliest convenience. New advertisements should be sent in as early as possible.

Mount Haleakala, Sandwich Islands.

A lady correspondent of the *Alta* writes:—

Mount Halcakala, or "house of the sun," rises in lofty grandeur, with a drapery of soft, fleecy clouds thrown around it. It is 10,000 feet above the level of the sea, and is a vast, dome-like mountain, in the form of an obtuse cone. The crater on its summit is 2,000 feet deep and 15 miles in diameter. Its fires have long since gone out, and vegetation now clothes its sides, where once the red hot billows of lava clashed against it, and birds twitter their wild glee notes, in return answered back by their mocking echoes. It is second only to Kilauea in point of attraction to the stranger visiting the Islands. It is seventeen miles distant from Makawao, and the ascent being gradual, the summit is easily attained, affording a pleasant horseback excursion. We started early in the morning, with a pleasant party, and arrived at the crater in six hours. The mountain is overgrown with vegetation, and the *ohelo*, a species of whortleberry, and the *poha*, the native gooseberry, and strawberries, grow on its sides in wild profusion. Ascending the first few miles the trail is quite smooth, but as you approach the summit the overflow of lava has formed a rough surface broken up in sharp-pointed rocks. About two miles from the summit there is a large cave, which affords a good shelter for those who wish to camp out and view the magnificent sunrise scene of Mauna Haleakala.

Among the lava rocks at the summit a singular plant is found, called the "Silver Sword." It shoots up several feet in a spear-like shape, from which hang green blossoms, while the base sends out long sword-shaped leaves of as bright silvery hue as the precious metal itself, presenting a beautiful appearance. It seems to flourish in barren lava soil alone, and if the excursionist should return with a specimen of the plant it is considered proof positive that one has made the ascent of Haleakala. From the great height and rarity of the atmosphere, persons often experience great difficulty of respiration—often causing a hemorrhage. The immense size of this crater impresses one with wonder, while the extensive view and scenery from its heights, with islands, mountains and valleys spread out beneath you like a map, is grand beyond description. A sunrise and sunset view shows better the true beauty of the scenery. The excursionist needs to be well provided with warm and water proof clothing, as the air at this height is freezing chilly, and often overspread with clouds and bathed in rain. In a clear day Mt. Haleakala often seems to repose on a bed of clouds, and as the wind sweeps them over the plains beneath or lifts them from valley to valley, sometimes covering all as with a veil of mist, and again curl after curl of this fleecy drapery lifting and floating off, or dancing along, hanging caressingly on its sides, the exquisite varying changes present a beautiful appearance.

A FREAK OF NATURE.—An emigrant boy arrived, a few days since, according to the Stockton *Independent*, having only two toes on each foot. His great toes were of extraordinary length and extremely crooked, very much resembling the claws of a crab. What makes the matter still more astonishing, the boy, it is said, belongs to a family whose hands and feet are all similar to his own.

Minerals of California.

We often hear, says the *Bulletin*, outside of California, of the high value and extended use of metals and minerals which abound in immense deposits in the Pacific domain. Bismuth, which is exclusively used in type-making and the mechanic arts, and is now very high and scarce, is said also to be found plentifully in one of our mineral formations. Antimony exists in immense masses near the Tejon, and can be carted away from the top of the ground, of very rich quality, and is said to contain a very handsome ley of silver. Zinc and tin, which are now very expensive metals, are met with in valuable lodes in the counties of Mono and Los Angeles. Chromic iron is found in immense abundance in Monterey and other southern districts. Iridium, osmium and platina are not scarce in the gold washings of Klamath and Del Norte counties, and discoveries of these have also lately been made in Tulare. The sulphur deposits of Clear Lake and those of Nevada Territory are on a magnificent scale and of the purest quality. Borax can be gathered by bushels nearly free from extraneous matter, and there is no end of it seemingly, in the mountains of Lake county, where obsidian or volcanic glass, ready to make wine bottles at a blow, is as plentiful as the world wants—a true mine of glass. Of kaolin of the finest quality there is no end; and of umber, tierra sienna, paint ochres of different colors, manganese and magnesian earths there is great plenty. As California has some of the purest aluminous clays in abundance, the new metal alumina could likely be profitably made. As to copperas, soda, alum, copper, agate, chalcedony, hematito and such like substances, there is no end of them. It would be interesting and important to owners of lands in which the various minerals above mentioned exist, to learn the markets and places of demand for them in Europe and the Atlantic States, and the prices which they ordinarily command there. Perhaps some correspondent who is familiar with the subject may have a few words to say about it.

WORKING SILVER ORES.—A great deal of disappointment and dissatisfaction will be certain to arise in the several new mining districts on this slope of the Sierras, mainly owing to parties undertaking the erection and running of mills, that are totally ignorant of any process for working silver ores. There is probably none of the metals that require more aid from the chemist and metallurgist to extract it from its ore, than silver; and yet parties wholly ignorant of either science erect a stamp mill, obtain a few iron pans, and then notify the world that they are prepared to do custom work; the result from which can be readily given in advance with prophetic certainty—the ore does not pay, and is condemned by the mill-owner, and, *vice versa*, the owner of the mine damns the mill. The ores in Alpine, so far as we have examined, contain silver in three different combinations—viz: argentiferous galena, black sulphuret, and native chloride of silver—the most being found in the black sulphuret form. Now each of the three combinations require a different process to extract the silver therefrom. Roasting furnaces have become necessary in nearly all operations in working silver ores, while in some cases smelting has to be resorted to in order to work it successfully. Now, if the owner of a mine takes ore to a mill, the superintendent of which is wholly ignorant of the character of the ore, the result of his working the same, in nine cases out of ten, will be a failure.—*Monitor Gazette.*

NEW VOLUME.—The *Mining and Scientific Press*, published at San Francisco, has entered upon its fifth year of existence. It has been enlarged to a sixteen page paper, and is flourishing like a green bay tree. (We don't insinuate that it is pickled.)—*Red Bluff Independent.*

Extracts from the Statutes.

The attention of companies who desire advertising their delinquent sales in any other paper than that in which the notice of assessment appears, is called to the following section of the law approved April 4th, 1864:

Section 7. If any portion of the assessment mentioned in said notice shall remain unpaid on the day specified therein for the publication of the notice of sale, the Secretary shall, *unless otherwise ordered by the Board of Trustees*, cause to be published in the same papers in which the notice provided for in section five shall have been published, a notice substantially as follows, &c.

If, from a matter of convenience or necessity, the publication of an assessment is delayed, a very simple remedy is found in the following section of the law, relating thereto:

Section 14. No assessment duly levied shall be rendered invalid by a failure to make proper publication of the notices hereinbefore provided for, nor by the nonperformance of any act required to be performed in order to enforce the payment of the same; but in case of any substantial error or omission in the course of proceedings for collection, all previous proceedings, except the levying of the assessment, shall be void, and publication shall be begun anew.

Our Patent Agency.

The PATENT AGENCY of the MINING AND SCIENTIFIC PRESS has been signalized with remarkable success during the past two years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of LETTERS PATENT from the United States and foreign Governments cannot be over-rated, and the Proprietors of the Press, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

IMPORTANT DISCOVERY
— IN THE —
Photographic Art.
Jacob Shew's
CHROMATIC PROCESS OF PRINTING PHOTOGRAPHS.

[PATENT APPLIED FOR.]

THE UNDERSIONED WOULD ANNOUNCE TO THE public that he has discovered a new and IMPROVED PROCESS for printing Photographs, which produces a

SOFTNESS, CLEARNESS AND DELICACY OF TONE

unattainable by any other known process and to which he has given the above name. It is applicable to any size of Photograph, and those having valuable old negatives which they desire printed by the improved process can do so at any time.

In order to secure the pecuniary advantages to be derived from this important discovery a patent has been applied for. When obtained, the privileges of the right will be disposed of at a reasonable rate to any Photographer desiring it. In the meantime all are warned against encroachments upon the rights of the discoverer as such will be prosecuted to the full extent of the law.

"Cartes de Visite" and large Photographs printed by this process will be furnished at the prices of the ordinary work of other establishments.

☞ The public are invited to examine specimens at my Gallery. ☜
JACOB SHEW.

ENLARGER.—The *Mining and Scientific Press*, of San Francisco, commenced its ninth volume to-day in an enlarged form. This valuable journal has been deservedly successful, and should have a large circulation among the mining community.—*Alpine Chronicle.*

To News Agents.—After this date we shall furnish no dealers, outside of this city, with the Press upon any other terms than those of regular subscription. Those who will forward us the names of new subscribers shall receive liberal commissions.

1852. 1864.

TWELFTH YEAR OF PUBLICATION.

THE GOLDEN ERA,

Founded in 1852.

The oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent, and correspondents of distinguished ability in New York, Paris and London.

THE GOLDEN ERA is now enlarged by the addition of eight columns to its pages—and presents fifty-six columns containing the greatest possible variety of Valuable and Entertaining, Original and Selected Matter, all combining to render THE GOLDEN ERA a Literary and Family Journal of surpassing interest and attraction; a Welcome Guest in Cottage and Cabin; the favorite at the fireside in City and Country, the most useful, agreeable altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe, and elsewhere. Every Household in the Mountains and Valleys, the Cities, Towns, and Mining Camps of California and throughout be Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor.

Serial Romances in the Golden Era.

The most popular Novels of the present day—

"THE DOCTOR'S WIFE," by Miss Braddon.

"OUR MUTUAL FRIEND," by Charles Dickens;

published as Serials, from week to week, in THE GOLDEN ERA, from advance sheets, simultaneously with their appearance in the English and Atlantic Periodicals.

Among the Contributors to the GOLDEN ERA are all the prominent writers of Literary Repute in California, and on the Pacific Coast; also correspondents and contributors of distinguished talent in the Atlantic States and Europe; including "Orpheus C-Kerr," Fitz Hugh Ludlow, G. B. Densmore, "Mark Twain," Dan De Quille, Florence Fane, Miss Emma Hardinge, Sarah E. Carmichael, Annie E. Fitzgerald, "Occasia Owen," Alice Mason, William Simpson, Chas. F. Stoddart, "Ina," H. C. Williston, "Albion," "Fairfax," Bonnevel, Mary Kyle Dallas, Margaret Hosmer, and many other accomplished writers of Fiction, Romance, Novels and Stories, Poetry, Essays, Sketches, etc., etc., comprising an array of Talent and Genius unapproached by any Literary Journal in California, the Atlantic States or Europe.

The proprietors of the GOLDEN ERA announce the receipt of advance Sheets of Miss M. E. Braddon's New Novel,

The Doctor's Wife,

The most brilliant effort of the celebrated author of "Aurora Floyd; "The Outcasts;" "Three Times Dead;" "Lady Audley's Secret;" etc., etc.

"THE DOCTOR'S WIFE," now in course of publication in London, is universally pronounced to be Miss Braddon's greatest production. It will be completed in sixteen numbers of THE GOLDEN ERA.

Take care to write distinctly the name of the person; the name of the city, town or locality where the Post office is situated, and the name of the County and State, in order that the paper may be fully and accurately directed to every address.

THE GOLDEN ERA TO CLUBS.

Parties (living remote from localities where agents are located) forming a club of five yearly or half-yearly subscribers, and forwarding the subscriptions (by letter registered and postage paid) to the office of publication in San Francisco, will be entitled to an additional copy of The GOLDEN ERA for the term of one year, or to retain the equivalent in cash.

AGENTS in every part of the State receive subscribtions or the GOLDEN ERA.

POSTMASTERS in California, Oregon, and neighboring Territories, obtaining subscriptions for the GOLDEN ERA and forwarding the same, with name and address of the subscriber, will be allowed a commission therefor.

PARTIES residing in localities where no Agents are established will forward their subscriptions by mail.

SUBSCRIBERS will be careful in writing as plainly and fully as possible, the direction of papers to be sent to any part of California, the Atlantic States, or elsewhere.

Now is the Time to Subscribe.

TO ADVERTISERS!

Best Advertising Medium—The "Golden Era" is the oldest Weekly Journal in California, and indisputably enjoys by far the largest circulation in the city of San Francisco and in the interior of the State.

THE GOLDEN ERA

Is universally read in every city, town, village, and mining and agricultural precinct in California, and offers unusual and unequaled advantages to those who desire to bring their business prominently before the community. Only a limited space is devoted to advertising. All advertising pages are also largely occupied with fresh and interesting reading matter, and no advertisement can escape attention. The charges for advertising are not so large, proportioned to the benefits derived, as those of other papers. Liberal terms will be made with those who advertise for three or six months, or by the year.

GOLDEN ERA POSTAGE.

POSTAGE on the GOLDEN ERA, to Mail Subscribers, in California and throughout all the States and Territories of the Union, per quarter, (3 months)..., 5 cts. To be paid quarterly, in advance, either at the Office of Mailing or Delivery.
POSTAGE on the GOLDEN ERA, Single Copies, transient, to be prepaid by stamps..... 2 cts.
POSTAGE on the GOLDEN ERA, to Mail Subscribers in the county (San Francisco) where published..... Free.

Machinery.

WHEELER'S

Amalgamating & Separating Pans.

IT IS ACKNOWLEDGED BY ALL WHO HAVE EXAMINED the principles and witnessed the operation of these Pans, that they are decidedly superior for triturating and amalgamating purposes to any other in use.

The most important principle connected with the operation of these Pans is the separation of the triturating process from that of extracting the amalgam from the sand.—The chief cause of loss of the precious metal arises from the passing off of the same in combination with the quicksilver, during the process of trituration, and in cleaning up. By the introduction of the Separating Pan to follow the triturating, this loss is entirely avoided. In working these machines there is no appreciable loss of quicksilver, and hence none of the precious metals.

Where these Pans have been introduced and operated by the side of others on sands from the same vat, the Wheeler Pans have uniformly gained a large percentage of metals, over its competitors, as well as a still larger percetage in the amount of work performed.

☞ These Pans may be seen in daily operation at the Miners' Foundry, on First street, San Francisco, where all Interested are invited to call and examine for themselves.
no16-tf ZENAS WHEELER.

Hepburn & Peterson's

AMALGAMATOR.

THE SUBSCRIBERS WOULD CALL THE ATTENTION of the Mining Public to their Reducer and Amalgamator, and also to their Separator for reducing and separating the mineral from

Gold and Silver Ores,

Manufactured and exhibited at the Vulcan Iron Works, Nos. 137 and 139 First street, San Francisco.

These machines secure to the Miner a more Expeditious and Perfect Reduction and Amalgamation, a less liability to accident and delay, and a greater amount of useful effect in proportion to the power employed to keep them in operation than any other machine now in use for producing similar results. This fact is attested to by their general adoption and preference at all the principal Reduction Works in Nevada Territory; among which may be mentioned the Gould & Curry Mill, the Silver State Reduction Works, Zephyr Flat Mill, Pioneer Mill, Eastern Slope Mill, Phœnix Mill, etc.

☞ This Amalgamator may be seen in operation at Kustel Bros. works, Bryant St. between 3d and 4th.

[Illustrated in the Mining and Scientific Press, April 9th, 864.] HEPBURN & PETERSON.

PRATER'S

PATENT CONCENTRATOR.

THE PROPRIETORS OF THIS NEW CONCENTRATOR, having completed arrangements for its manufacture at the Fulton Foundry, in this city, now offer it to the public, with the fullest confidence that for the purpose for which it is designed

It Has No Equal in Use.

The principle of this machine, which is designed for a Concentrator exclusively, is entirely new. It is designed for separating finely divided quicksilver, amalgam and gold from the sands, and for concentrating and saving the sulphurets, and is to be placed behind all or any other machine in use.

This machine is now running on waste sands, from which it is taking out an average of 3½ pounds of quicksilver for each ton of sand. Orders or letters of enquiry may be addressed to

HUNGERFORD & PRATER, Proprietors.
San Francisco, April 1st, 1864. 14v8-tf

DUNBAR'S

PATENT SELF-ADJUSTING

Piston-Packing.

Requires no Springs or Screws; Is always Steam Tight, without excessive friction, and never gets slack or leaky.

IT WILL SAVE EACH SEASON MANY TIMES ITS COST in friction, time, steam and power. No engine, old or new, should be without it. It can be easily fitted to old or new Pistons.

Having obtained the Agency of this VALUABLE IMPROVEMENT, I am prepared to furnish it wherever desired. For further information, address HENRY S. SMITH,
23v8 Golden State Iron Works, San Francisco.

To Quartz Miners.

ALL PERSONS INTERESTED IN MINING MACHINERY are invited to call at the Pacific Foundry and examine my improved Amalgamator. It is unquestionably superior to anything now known for amalgamating Silver and Gold. It works 1000 pounds at a time, and will amalgamate over three tons a day. By the motion of the revolving muller, the pulp is drawn through its center and passes under it, between the grinding surfaces, to the circumference; from whence it passes again over the muller to the center, through the holes and between the grinding surface to the circumference as before. Thus a constant circulation of the pulp is kept up, bringing the particles of ore again and again under the muller, and reducing the whole mass to an impalpable powder.

No quicksilver lies between the surfaces to be ground, but at the circumference and center of the pan where the metal must pass through it as the pulp circulates.

A patent was granted for this Amalgamator in December last, and all persons are again warned against purchasing machines made at the Miners' Foundry, called "Wheeler's Amalgamator," as they are an infringement on my patent, and a suit is now pending in the U. S. Circuit Court against the parties infringing. My Amalgamator can be seen running at the Pacific Foundry, where all can judge of their operation and the very superior style in which they are being manufactured. THOMAS VARNEY.

Disney's Cylinder Amalgamator.

The Cheapest and Best.

DISNEY'S CYLINDER AMALGAMATOR, WHICH HAS recently been introduced to the public, has already been proved a complete success, and can be furnished, at a price cheaper than any other in use. It is simple in construction, and so arranged as to do a large amount of work with the smallest expenditure of power. The proprietor is satisfied that he can do more work in a given time and with a given expenditure of power than any other amalgamator in use. For small companies who desire cheap yet effective machines, none can be more desirable.

It may be seen in operation at the Rail Road Foundry on Fremont street where

A NEW CRUSHER

Is in operation and he can crush and Amalgamate at the LOWEST RATES. Miners and all others interested are invited to call and examine for themselves.

M. DISNEY, Patentee.
San Francisco, June 23, 1864. 1-3m

IMPROVED WATER-WHEEL,

— PATENTED BY —

JOHN TYLER, WEST LEBANON, N. H.

Giving the Maximum Power with the Minimum Cost; Having the Following as Some of Its Advantages Over Others—Giving the Best Percentage of Water Used, Durability,

It runs Equally as well IN Back Water as OUT.

IT IS ADAPTED TO HIGH HEADS OR LOW—IT IS NOT LIABLE to get out of repair—It can be put to running by any Machinist in a very short time—It is the steadiest running and easiest regulated wheel in use—There are now some 800 of them in use in the United States and Canadas, running under all heads, from 4 to 80 feet, and giving universal satisfaction. Address

SMITH & HANSCOM,
15v8-3m Golden State Iron Works, San Francisco.

HUNT'S

IMPROVED WIND-MILL.

THIS WIND-MILL IS RAPIDLY taking the place of all other Mills on the Pacific Coast. These Mills are so simple in their construction, that when once built, they can be put in order by almost any person; and when once in order they will run for years without repairs.

Prices, from $50 to $1,000.

ROUND AND SQUARE WATER TANKS BUILT TO ORDER.

HUNT'S PUMPS

Are admitted to be the best in the Market for Wind Mills, being built expressly for that purpose. They can be set, and taken apart with common wrenches, and are very easily repaired.

HUNT'S ENDLESS CHAIN

HORSE POWER

For Sawing Wood.

ALSO, THE

Self-Regulating Horse Power

Is so arranged as to give a steady motion, and is calculated to be used for turning Wood, Iron or Brass, also for Scroll or Circular Sawing, and is fully equal to Steam for any light work. The above Machines are built of the best materials, and made as Durable as Wood and Iron will make them.

ALL WORK WARRANTED.

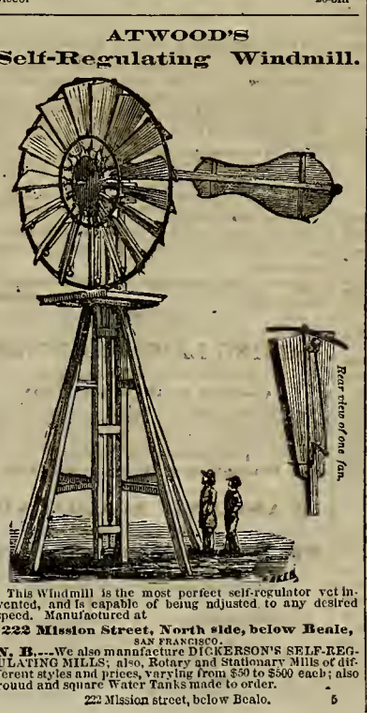
☞ For further Particulars see small circulars. ☜

E. O. HUNT,

No. 28 Second Street, and 108 & 112 Jessie Street, San Francisco. 26-3m

ATWOOD'S

Self-Regulating Windmill.



This Windmill is the most perfect self-regulator yet invented, and is capable of being adjusted to any desired speed. Manufactured at

222 Mission Street, North side, below Beale,
SAN FRANCISCO.

N. B.—We also manufacture DICKERSON'S SELF-REGULATING MILLS; also, Rotary and Stationary Mills of different styles and prices, varying from $50 to $500 each; also round and square Water Tanks made to order.

222 Mission street, below Beale. 5

TO QUARTZ MINERS.

Hinkle's Centrifugal Pulverizer and Amalgamator!

THE ATTENTION OF MINERS IS RESPECTFULLY requested to HINKLE'S CENTRIFUGAL PULVERIZER AND AMALGAMATOR, now manufactured and in operation at the NOVELTY IRON WORKS of E. T. Steen, Nos. 37 & 39 Fremont street, between Mission and Mission streets.

This machine is the best in the State for the purpose of Pulverizing and Amalgamating ORES. The whole machine entirely of Iron, will not exceed One Ton, and no piece of it will exceed 200 pounds, which makes it very convenient for transportation to remote districts. It will do Two Tons of Rock per day.

Mr. Hanson, who is running one of the machines, is an experienced Amalgamator, and will receive Ores at the above named place, and extract the metals and furnish, as he says for all persons wishing the same. The Subscriber is also perfecting a HAND MACHINE for Miners engaged in prospecting, which will work 25 pounds of ROCK at a time, and which will weigh about 25 pounds.

The Pulverizer and Amalgamator works Rock of the size of a grain of corn to an impalpable powder. Apply to

PHILIP HINKLE,
At the Novelty Iron Works, Nos. 37 & 39 Fremont street.

SALMON'S

PROPELLER AMALGAMATOR.

The proprietors and inventors of this machine, after fourteen years of practical experience in milling in California and Nevada Territory, and having a thorough knowledge of the wants of Miners and Mill men, have succeeded in making an Amalgamator, which, for the purposes intended, far surpasses any other yet presented to the public, and which can be furnished at less than one-half of the expense of any other Amalgamator, now in use, besides requiring less labor to clean and keep it in running order. The Amalgamator is simple in its construction, consisting of a pan or tub constructed of wood and adapted to either Stone or Iron bottom. Opposite each other, and on the side of the tub, are two flanges, from two to four inches broad, reaching from the top to near the bottom, wither for the mullers to pass under. These flanges are for the purpose of preventing the pulp from forming a circular current, and together with a number of wings placed like a screw propeller on the muller-shaft, force a current contrary to that usually on the quicksilver at the bottom and under the grinding surface of the mullers. This is peculiarly of proper screw and side wings, in combination with a deep tub is what the proprietors claim as new and for which a patent has been applied for. The Inventors of this machine are practical Mechanics as well as experienced miners, and the machine offered by them to the public is the result of long experience and close observation. Manufactured at the San Francisco Foundry, San Francisco, Cal. by

J. & W. C. SALMON.

To whom all orders should be addressed.

Hudson's Improved Pump,

(Specimen on Exhibition in the Pavilion.)

Plumbing and Gas Fitting in all its Branches.

Miscellaneous.

KELLOGG'S PATENT

IMPROVED NEWBURY

PRINTING PRESS.

This New, Cheap, and most Desirable

JOB PRINTING PRESS

Can now be seen in operation in San Francisco, at the office of the MINING AND SCIENTIFIC PRESS, corner of Washington and Sansome streets.

Kellogg's Improvement

Is the addition of a very simple, but ingenious and effective method of self-delivering of the cards or printed sheets from the Newbury Press.

It costs less, weighs less, and prints faster than any of the ordinary Job Presses now in use. Any Journeyman or apprentice, who understands working the Washington hand press, will have no difficulty in operating this machine.

As a Cheap and Simple Press, for small Printing Offices in the interior, it highly recommends itself.

Address, **L. M. KELLOGG.**
October 29th, 1864. San Francisco.

Putnam's Clothes Wringer.

IT IS THE ONLY RELIABLE SELF-ADJUSTING WRINOer. No wood work to swell or split. No thumb-screws to get out of order. Warranted with or without cog-wheels. It took the FIRST PREMIUM at Fifty-Seven State and County Fairs in 1863, and is WITHOUT AN EXCEPTION the best Wringer ever made, Patented in the United States, England, Canada and Australia. Agents wanted in every town, and in all parts of the world. Energetic agents can make from three to ten dollars per day. Sample Wringer sent Express-paid on receipt of price. No. 2, $6.50. No. 1, $7.60. No. F, $8.50. No. A, $9.50. Manufactured and sold, wholesale and retail, by

THE PUTNAM MANUFACTURING CO.,

No 13 Platt Street, New York, Cleveland, Ohio and Bennington, Vt. S. C. NORTHROP, Agent.

What Everybody Knows,

Viz: That Iron well galvanized WILL NOT RUST; That a simple machine is better than a complicated one; That a Wringer should be self-adjusting, durable and efficient; That Thumb-Screws and Fastenings cause delay and trouble to regulate and keep in order; That wood soaked in hot water will swell, shrink and split; That wood bearings for the shaft to run in will wear out; That the Putnam Wringer, with or without cog-wheels, will not tear the clothes; That cog-wheel regulators are not essential; That the Putnam Wringer has ALL the advantages, and not one of the disadvantages above named; That all who have tested it, pronounce it the best Wringer ever made; That it will wring a Thread or a Bed-Quilt without alteration.

We might fill the paper with testimonials, but insert only a few to convince the skeptical, if such there be; and we say to all, TEST Putnam's Wringer. Test it THOROUGHLY with any and all others, and if not entirely satisfactory, return it.

Putnam Manufacturing Co:—

GENTLEMEN. I know from practical experience that Iron well galvanized with zinc will not oxydize or rust one particle. The Putnam Wringer is as near perfect as possible, and I can cheerfully recommend it to be the best in use.

Respectfully yours,
JNO. W. WHEELER. Cleveland, Ohio.

Many years experience in the galvanizing business enables me to endorse the above statements in all particulars.

Now York, Jan., 1864. JNO. C. LEFFERTS.
No. 100 Beekman St.

We have tested Putnam's Clothes Wringer by practical working, and know that it will do. It is cheap; it is simple; it requires no room, whether at work or at rest; a child can operate it. It does its duty thoroughly; it saves time and it saves wear and tear. We earnestly advise all who have much washing to do, with all intelligent persons who have any, to buy this Wringer. It will pay for itself in a year at most. HON. HORACE GREELEY.

6-tf

ENLARGEMENT.—The Mining and Scientific Press has again been enlarged by the addition of a fourth column to every page. It is conducted with ability and enterprise, and is meeting with the constantly increasing patronage which it deserves. There is a straightforwardness and fearlessness about it which we admire.—*S. F. Evangel.*

For Advertising Assessments on Saturdays.

Levy your Assessments upon any day EXCEPT FRIDAY.

Advertise the ASSESSMENT NOTICE on the FIRST FOUR SATURDAYS succeeding the day upon which the assessment is levied.

Appoint the day for advertising the DELINQUENT SALE on the FIFTH SATURDAY succeeding the date of levying the assessment.

Appoint the DAY OF SALE on the SEVENTH SATURDAY succeeding the date of levying the assessment, or any day *previous* to the Eighth Saturday.

Assessments ordered upon Saturday afford the Secretary the longest term in which to effect his advertising at the mine.

Mining Notices--Continued.

And in accordance with law, and an order of the Board of Trustees, made on the 24th day of September, 1864, so many shares of each parcel of said stock as may be necessary, will be sold at the office of the company, on the 5th day of November, 1864, at the hour of 1 o'clock, P. M., to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

J. WARREN CLARK, Secretary.
Office, No. 430 Montgomery street, San Francisco. [14

POSTPONEMENT.—The above sale is postponed until Monday, November 21st, 1864, at the same hour and place. By order of the Board of Trustees.

17-4 J. WARREN CLARK, Secretary.

New Era Copper Mining Company, Salt Spring District, Tuolumne County, California.

Notice is hereby given that at a meeting of the Board of Trustees of said company, held on the 10th day of October 1864, an assessment of 25 cents per share was levied upon the capital stock of said company, payable on the 7th day of November, 1864, in United States gold coin, to the Secretary.

Any stock upon which said Assessment shall remain unpaid on Saturday the 12th day of November, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday the 26th day of November, 1864, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

C. B. TOWLE, Secretary.
Office, south west corner Washington and Stockton streets San Francisco.

Napa Gold and Silver Mining Company, Silver Mountain District, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 17th day of October, 1864, an Assessment of thirty (30) cents per share was levied upon the Capital Stock of said Company, payable on the 19th day of October, 1864, in United States gold and silver coin to the Secretary, or to S. A. HAWKINS, Superintendent, Silver Mountain.

Any stock upon which said Assessment shall remain unpaid on Saturday, the 19th day of November, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 3d day of December, 1864, to pay the delinquent Assessment, together with the costs of advertising and expenses of the sale. By order of the Board of Trustees.

J. WARREN CLARK, Secretary.
Office, 430 Montgomery street, San Francisco. Sale at the office of the company, at 1 o'clock P. M 17-4

Owens River Canal Company.—Annual Meeting.

Notice is hereby given, that the regular Annual Meeting of the Owens River Canal Company, for the election of officers for the ensuing year, and the transaction of any other business that may come before the meeting, will be held at the Office of the Company, Room No. 2, second floor, No 302 Montgomery street, corner Pine, at 7½ o'clock, in the evening of Saturday, the 26th day of November next.

T. L. BIBBINS, Secretary.
San Francisco, Oct. 28th, 1864. 18-td

Ontario Mining Company, Little Miami Ledge, Reese River Mining District, Lander county, N. T.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 17th day of October, 1864, an assessment of twenty-five cents per share was levied upon the capital stock of said company, payable immediately, in United States Gold and Silver Coin, to the Secretary, or to Jos. S. CURRIE, in Austin, N. T.

Any stock upon which said Assessment shall remain unpaid on Saturday, the 3d day of December, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 17th day of December, 1864, to pay the delinquent Assessment, together with the costs of Advertising and expenses of the sale. By order of the Board of Trustees.

C. H. BURTON, Secretary.
Office, Room No. 4, N. W. corner Clay and Front streets San Francisco, Cal, 19-4t

La Libertad Gold and Silver Mining Company, Cacachillas District, Lower California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 26th day of July 1864, an assessment of one dollar per share was levied upon the capital stock of said Company, payable on the 3d day of September, 1864, in United States Gold and Silver Coin, to the Secretary.

Any stock upon which said assessment shall remain unpaid on Saturday, the 19th day of November, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on the 3d day of December, 1864, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

C F Lott	116	50	25 00

And in accordance with law, and an order of the Board of Trustees, made on the 7th day of September, 1864, so many shares of each parcel of said stock as may be necessary, will be sold at by public auction John Middleton & Son, on the 29th day of October, 1864, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale.

N. DUPERU, Secretary.

Office, No. 710 Sansoma street. 16

Postponement.—The above sale is postponed until Monday, November 7th, 1864, at the same place and hour. By order of the Board of Trustees.

17-3t N. DUPERU, Secretary.

Worth Considering.—Advertising has proved the medium of success to many of the most prominent business men of the world. Merchants, Inventors, Builders, Patentees, Manufacturers, Foundrymen, Machinists, and, in fact, all who wish to call the particular attention of the Mining, Professional, Mechanical and Industrial members of the community to their business, should not fail to advertise in the Mining and Scientific Press. The circulation of the paper is extensive, and has a wide range, reaching the most intelligent readers in every mining settlement of importance on the coast. A large number of copies are also sent East. Our terms are reasonable. "Live and help live" we believe to be a sensible motto.

Stars and Stripes Copper Mining Company,
Rock Creek District, Calaveras County, California

Notice is hereby given, that at a meeting of the Board of Trustees of the said Company, held on the 8th day of October, 1864, an assessment of ten(10) cents per share was levied upon the capital stock of said Company, payable on the 10th day of October, 1864, in United States gold coin, to the Secretary, at his office on Rock Creek.

Any stock upon which said Assessment shall remain unpaid on Saturday the 10th day of November, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on the 26th day of November, 1864, to pay the delinquent Assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

J. J. FINDLEY, Secretary.

Office, Rock Creek, Calaveras County. 16-4

Sisters and Augusta Gold and Silver Mining
Companies. Location—Augusta District, Lander County, Nevada Territory.

Notice is hereby given, that at a meeting of the Board of Trustees of said Companies, held on the 19th day of September, 1864, an assessment of 15 cents per share was levied upon the capital stock of said Companies, payable on the First day of October, 1864, in United States gold or silver coin to the Secretary, at the office of said companies, or to John Moffet, Superintendent, at the mine.

Any stock upon which said assessment shall remain unpaid on Saturday the 29th day of October, 1864, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 19th day of November, 1864, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

L. O. DODGE, Secretary.

Office No. 406 Front street, San Francisco, Cal.
September 20th, 1864. 13-4t

Postponement.—The advertisement of stock delinquent on the above assessment is hereby postponed until Tuesday, November, 8th, 1864. By order of the Board of Trustees.

18 L. C. DODGE, Secretary.

Postponement.—The advertisement of delinquent stock on the above assessment, is postponed until Saturday, the 19th day of November, 1864, and the sale thereof is postponed until Monday, December 5th, 1864. By order of the Board of Trustees. 19 L. DODGE, Secretary,

United States Mining Company, Virginia District, Nevada Territory.

Notice.—There are delinquent upon the following described stock, on account of Assessment levied on the 30th day of September, 1864, the several amounts set opposite the names of the respective shareholders, as follows:—

Office, Nos. 8 & 10 Government House, corner Washington and Sansome Streets, San Francisco, Cal. oct29-18

Mining and Scientific Press.—This well conducted journal has entered upon its ninth volume. It it a sterling periodical, and deserves encouragement.—*Territorial Enterprise*

STILL IMPROVING!

VOLUME IX
—OF—
The Mining and Scientific Press
COMMENCED
ON THE FIRST OF JULY, 1864,
WITH
An Enlargement of Its Pages.

Sixty-Four Columns in Each Number.

PUBLISHED EVERY SATURDAY.

THE PROPRIETORS of this useful and now important journal xperience much satisfaction in returning acknowledgements to their ardent friends and rapidly increasing patrons who have substantially contributed to the remarkable success of the PRESS during the past six months. By aid of the ACCUMULATING PATRONAGE now being properly bestowed upon the

ONLY TRUE MINING AND MECHANICAL MEDIUM

Upon this Coast, we are enabled to prove our appreciation of such marked favor by rendering the public one of the

Largest, Handsomest and Most Useful

Journals now published. With this view we shall exert our best energies, and continue to make the MINING AND SCIENTIFIC PRESS substantially

An Instructor to Prospectors,
An Economist to Millmen,
An Assistant to Active Miners,

An Economizer for Mining Advertisers,
A Reliable Reporter for Shareholders.
A Faithful Monitor for Stockdealers,

An Intelligencer for Mechanics,
An Incentive to Inventors,
A Reflector for Patentees,

And a Helpmeet to all Industrial Classes,

In fact, upon the Pacific Coast. We shall give accurate and frequent

DRAWINGS AND ILLUSTRATIONS

Of new inventions and discoveries of particular value to Miners, Mechanics and Manufacturers, their interests in this community being well considered "one and inseparable."

THE SHAREHOLDERS' DIRECTORY

Will comprise a record of all Notices of Meetings of Mining Companies, Notices of Assessments, amounts levied, date of advertising sales, and day of sales, announced in all advertisements appearing in the San Francisco papers during the period of the Volume.

STATISTICS FOR REFERENCE

And Reports of Elections of Officers of Mining Companies. Stock Reports, Valuable Tables, etc., will be continued with careful attention.

OUR PATENT AGENCY

Is increasing in importance and value to the Inventors of the Pacific Coast, as many Patentees can testify from their successful applications through us during the past twelve months.

FOR SENDING ABROAD.

As a paper for mailing regularly to your friends in the East, ort o correspondents elsewhere, none can be selected more appropriate, or better calculated to dispense reliable information with regard to transpiring events on this coast and the progress of California.

Specimen copies will be sent free to those desiring to examine the paper before subscribing. Postmasters, Express Agents and News-dealers, acting as our agents, will receive liberal commissions.

Friends pleased with our efforts in the publication of the PRESS can render us essential aid by furnishing correspondence and all important information which may come under their observation, and by calling the attention of their neighbors to the commendable features of the paper; the appreciation of which favors will be duly manifested by the constant improvement of our journal.

SUBSCRIPTION IN ADVANCE.

One Year, (two volumes)..... $5.00
Six Months, (one volume)..... 3.00

FOR ADVERTISING

Our terms are very reasonable. MINING COMPANIES are especially favored by our rates, and careful attention is given to the publication of MINING NOTICES.

OFFICE in Government House, Nos. 56 and 57, corner of Washington and Sansome streets, San Francisco.

DEWEY & CO., Publishers.
C. W. M. SMITH.....W. B. EWER.....A. T. DEWEY.

INVENTORS AND INVENTIONS.—Let us not cheapen inventions, but be kind to the inventors; beware of killing the goose that lays the golden egg! Many inventors die before the hour of triumph; others falter by the way. Invention is a struggle, a conflict, almost a battle; if the victors are rewarded, the dead are honored and the wounded carefully attended to. Glorify the inventors who succeed; cover with an indulgent self-respect the faults of those who fail; and soothe the last years of the wounded—those invalids of industrial science who have known only the pains of the fight, and always remained ignorant of the joys of victory. —[Dumas.

RAILROAD HOUSE.

316, 318 & 320 Commercial Street,

SAN FRANCISCO.

THE Undersigned respectfully notifies his Patrons, and the Public generally, that he has assumed the entire charge of above popular House, and having had it thoroughly renovated, he flatters himself it will compare favorably, in point of comfort and cleanliness, with any House in the city. It is his intention to make it a First Class

Family Hotel.

Being conducted on the European plan, it is not only the CHEAPEST RESPECTABLE HOTEL, but the most convenient as guests can choose their own hours of eating. The Restaurant is now conducted by O. Y. DAWSON, Esq., formerly of Sacramento, late of Marysville, whose name is a sufficient guarantee of the best of living.

The Railroad House Coach conveys passengers to the hotel FREE. Barber Shop, Bath Rooms, Steam Baths, etc., connected with the House.

18-q **C. L. ROSS, Proprietor.**

"MINING AND SCIENTIFIC PRESS."—This excellent and valuable paper has been enlarged by the addition of sixteen columns. It is one of the most complete and interesting mining journals in the United States.—*Daily American Flag.*

MINING SHAREHOLDERS' DIRECTORY.

List of Notices of Meetings, Assessments and Delinquent Sales.

Comprising the Names of Companies, District or County of Location, Amount of Assessment; Date of Meeting, Delinquent Advertisement and Sale, and the Place of Business of the Corporation if it is not in San Francisco.

BRANDRETH'S PILLS.

This Medicine often Cures when all others have failed. They prevent Apoplexy; they Cure Diseases of the Heart and Nervous Diseases, and as a

Purgative and Bilious Pill,

They have not their equal in the World. Employed according to directions, accompanying every box of new style, they produce

Great Purity of the Blood and the System Generally,

Causing only the removal of vitiated matters which have become useless or injurious, and securing in the reconstruction of diseased parts of nothing but sound and healthy materials.

THE USE OF BRANDRETH'S PILLS
OCCASION
The Actual Decrease of the PRINCIPLE OF DEATH, and an Increase of the Vivifying, the Life Principle.

B. BRANDRETH,
294 Canal Street, New York.

W. F. BRANDRETH,
Office at Crane & Brigham, San Francisco.

By sending $1 in coin to the above address, five boxes of pills will be sent to any part of this coast or the interior, Free of charge. 16-2m&cSp

Industrial Drawing Academy.

No. 408 Pine Street, near Montgomery.

Open for pupils every Evening from 7 to 10 P. M. Architectural and Mechanical Drawing classes now forming. Parties wishing Drawings executed by practical Draughtsmen in either of those branches may have it done by calling at the Academy. 12-3m **P. BELLE.**

How to make your Remittances.—In most of the mining towns, bankers will furnish checks on San Francisco at par, (or at a very slight advance) to those who wish to pay us for subscriptions, advertising, mining blanks, etc. When it is more convenient, money may be remitted by mail at our risk if the parties sending will register their letters. Money sent by mail is seldom lost if properly enclosed. An excellent method is that of opening the layers of a card, placing the coins between the layers and sealing the edges together.

PATENT HORSE-POWER MACHINE.

Machines driven by horse-power are very common in many parts of the country where neither steam, water, nor wind are available or desirable. Such machines are used to impart motion to other machinery, and circular saws, lathes, and other tools may be cheaply operated by them. The engraving published herewith represents an improved horse-power, which has some novel features worthy of attention. Appended is the inventor's description:—

A is the wooden frame work of the machine, and B a wooden pulley, over which the endless floor runs. This pulley, and a similar one placed at the other end of the frame, A, has a face nearly equal to the width of the floor on which the horse works.

C is an endless chain, one on each side, but only one is shown. This chain is composed of cast-iron links, six inches in length, having grooves running the whole length of their under sides, in which are wrought-iron links, connecting with the cast links by rivets. The chain is flexible in one direction, but stiff and rigid in all others—doing away with the numerous small rolls and railroad track generally used in machines of this character, and lessening the friction.

D is the wooden platform composing the floor on which the horse walks; the pieces composing it are hollowed out on the under side to fit the curve of the pully, B, and are fastened to the endless chain by bolts.

The rolls, E, support the endless chains; there are six rolls on each side. The pulley, F, drives the iron balance-wheel, G, by means of a belt. H, is another pulley, and I a belt for leading off the power to the desired point.

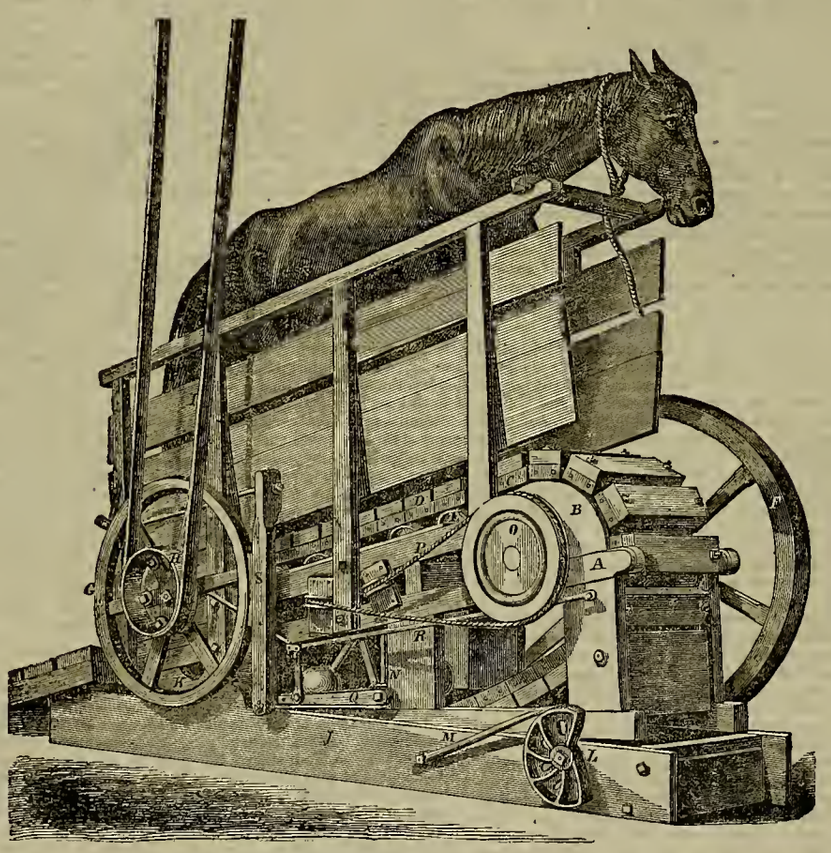
J is an additional frame in which the machine sets, supported at K, by a bearing, and at L, by a pair of cams, one under each side. By these cams the front end of the frame, A, can be raised or lowered, being held in the desired position by the pawl, M, thus giving a greater or less inclination to the floor without altering the tension of the belt, I. This can be done while the machine is in motion.

A common governor, N, is driven from the pulley by the belt, P; also connected by the lever Q, and rods R, to the brake S. This brake acts on the face of the balance-wheel G. An increase of speed in the machine causes the balls to rise and work the levers, passing the brake on the wheel, G, and checking the motion. By this arrangement small machines can be run with regularity of a steam engine.

On the opposite side of the machine is a binder-brake, so arranged, that in case the driving-belt should come apart, or slip off the pulley, the machine is stopped immediately, preventing any injury to the horse or the machine, and making it safe to leave the horse at work in care of any person.

This machine has but twenty journals, against some eighty in other powers of this class; each journal runs in a proper journal box, fully protected from dirt. It does not require oiling oftener than once a day, making a large difference in favor of this horse-power.

In places where a light power is required for but a portion of the time, this class of machines has advantages over steam-power, as they are worked with less cost, and require less care, than an engine. It is claimed that this particular machine contains improvements in construction, in addition to the apparatus for self-regulating, which makes it a superior one. For further particulars, or for purchase of rights, apply to the inventor, D. W. Hunt, 28 Second street, San Francisco. The machines are now being made by E. O. Hunt, at his well known windmill factory.



HUNT'S HORSE-POWER MACHINE.

Rush of Water in the Ophir Mine.—On Sunday night last the workmen in the Ophir mine struck a large body of water supposed to proceed from the Virginia ledge. On Monday night it had raised 200 feet in the main shaft, and continued rising until it reached the seventh gallery, about 300 feet from the lowest part of the mine. At latest dates the pumping apparatus of the company had been brought to bear effectually upon it, and it was rapidly receding. No serious damage had resulted from the influx, and the officers of the company feel confident that they have struck and are now draining the old Virginia Ledge.

Copper Ore.—We have received from W. L. Moore, of Taylorville, two very superior specimens of copper ore, of the gray ore variety; No. 1 being taken from the Peacock ledge, on Grizzly creek, Plumas county, and from a depth of 70 feet. No. 2 is from the Mineral Point ledge, in the same neighborhood, and was from a depth of 40 feet. The ledge of No. 1 is well defined, about three feet between the walls. The strata of gray ore, like the sample sent, is about 18 inches wide. The ledge of No. 2 is also well defined, and carries a streak 12 inches wide like sample sent. These specimens will compare favorably for copper with any ore we have ever met with. They carry a large quantity of green carbonate, and will probably reach fully 50 if not 60 per cent. of copper. Mines which will produce such ore must soon become valuable. Plumas bids fair to become one of the most important copper mining counties in the State.

Figs and Olives.—Figs and olives were introduced into California over 60 years ago, and have taken to the soil admirably, very seldom failing to give abundant crops whenever they were planted in proper climate and soils. Some of the olive trees near Santa Barbara and San Buenaventura, are 60 years old and are still thrifty. The fig, however, has to be more carefully attended to. Dried figs of an excellent quality, from the black variety are put up every season in the South. The olives of San Fernando, San Gabriel and San Diego, when picked, are said to surpass in flavor and size, during some years, even those of Seville; and the oil is fully equal, when properly prepared, to that of Florence. The olive tree does not bear an abundant crop except every two or three years; and this year the fruit in the old missions of the South is a very scanty crop, though large in size. In 1863 the trees yielded immensely and considerable quantities of oil were made, which sold well. The crops of figs have been very abundant in many places this year, but the quality is generally much inferior to that of former seasons.

Do Animals Reason?

They can be instructed up to a certain point. What is called the "cunning of the fox" is nothing but his quick sagacity. A multitude of stories—even enough to make quite a volume, could be gathered, illustrating the sagacity of the elephant, the horse, the dog, and other animals. Even the stupid "ass knoweth his master's crib." A fox has been known—so I have been told to carry off a small pig. In the course of his way back to the woods he had to cross a deep creek, setting up from the sea. He could jump over it himself. But could he jump over it with the pig in his mouth? That was the problem to be solved. He went off a little way and came back with a pine knot, a piece of a broken limb, in his mouth. It was just about as heavy as his pig. "Now," says he, "if I can jump across this creek with the knot in my mouth, I can also with the pig." In a moment he gave a leap and over he went. He then laid down his knot, jumped back again, seized the pig, and stood a moment as if weighing and comparing the two. He hesitated but a moment, when, presto! he was over,—pig and all. Was this not reasoning and logic? Could a philosopher or a divine have drawn a more accurate inference?

A dog had been accused of killing sheep. He and his master were very fond of each other. It was a long time before the owner could be made to believe the ill report about his favorite. At last he was convinced that poor Rover was guilty. As he could not bear to kill him himself, he came into the room one morning and said, "Peter, after breakfast you may take the dog off and shoot him. Mind and kill him dead?" The dog was in the room and heard it. In an instant he darted out of the room and was off in a straight line. No calling or shouting could cause him to turn his head. Straight as an arrow, he shot across the lots and went out of sight. Every hour they expected him back. At night he certainly would come. But no, he never returned! Many months after this, his master was riding on horseback in a wild, lonely place. Just as he came between two banks, through which the road had been cut, he saw poor Rover standing on one of the banks. His heart yearned towards his old friend, and he spoke to him very kindly. But Rover's heart was hardened. He gave one growl, snapped his teeth at his old master, again scampered off at the top of his speed. His master never saw him again! Unforgiving Rover! Thy memory was good, and thy will was strong, and thine anger lasting!

One more example. A neighbor of mine had a very knowing cat. Of course, Tab was a great favorite with all the family. At a time when Tab had a family of kittens, beautiful kittens too, and when it seemed as if it was too much for her to take care of them, one of them was given away to a neighbor. Little kit was carried off in a covered basket, and was warmly welcomed. In a day or two the door being opened, in walked Mrs. Tab, who seized her kitten and made off with it,—seeming delighted to find her child. In about three weeks she came back again, tugging her kitten, and laying it down at the feet of the mistress of the house, seeming to say, "Madame, this kit was to young when you took it before. It needed my care. But now is grown up and can get along very well. You may now have it." With that Mrs. Tab walked off, leaving her kitten, and never returning for it.—*Dr. Todd.*

Freed Slaves.—The Philadelphia *North American* calculates that thus far, 1,368,000 slaves have become free by the operations of the war.

The Sonora and Aurora Road Completed.—The new wagon road across the Sierra Nevada, from Sonora to Aurora, is now completed.

[Written for the Mining and Scientific Press.]

NEVADA CORRESPONDENCE.

Ens. Press :—I am no "Richmond" in the literary field, as you will perceive ere you have done with my scribbling, and yet I am none the less suffering under a severe attack of the *cacoethes scribendi*, and I fear nothing will cure me but an application of printer's ink, or some sensible advice to the effect that I am more eminently qualified for household duties—washing dishes and minding babies—than for driving the quill and putting on the airs of a veteran blue-stocking. But please don't *say* that, even if 'tis so, for I am sure, in my disappointment, I would go and do something dreadful—commit matrimony or suicide.

And now for a piece of my mind. I think it is only fair that you should devote a small portion of you valuable paper to those aspirants for literary fame, be they stern or fair, who have not yet won the "laurel and bay." A very obscure corner will do, and I give you my word that so far as the softer sex are concerned, we will not disturb the equilibrium of those dignitaries who, with elevated feet, ink-stained fingers, hair on end, and visage elongated with that consequential self-important air which men know so well how to put on, lounge in their smoke-begrimmed rooms, complacent and self-satisfied over the knowledge that they bear the honored appellation of Reg. Cor. to the *Mining Press*. Ah, me! what wouldn't I give to be in their place—that is, so far as would entitle me to bear the above honored cognomen, not envying them the possession of the pantaloons.

Now, Mr. Editor, I shan't listen to your mutterings about women knowing nothing beyond idle gossip and fashionable nothings, for I *do* know how to spell ph-th-is-ic, and *can* see a lady friend without launching into criticisms on her dress or relating some scandal about her, and I *have* sufficient nerve to explore the innermost depths of our great silver mines, and even to examine into the frightful bughear of Washoe—the "one ledge theory." May I pass?

THE COUNTRY IN WHICH WE LIVE.

I was in your city at a time when the population—good, bad and indifferent, widows, rag-pickers, servant-girls, and "any other man"—was eloquent upon the subject of feet, and the individual who did not possess these desirable articles in the "Modern Humbug," or "Mountain Alligator," was at a "discount;" and ere starting forth, I naturally prepared myself to behold wonders in the way of searching after the hidden treasures. I have not been disappointed, and Virginia City, with her adventurous population, exhibiting costumes and complexions of many climes, her habitations of all architectural schools, and her myriads of indisputably rich mines, is a "fixed institution;" and though, at the present moment, business may be depressed, and twenties few and far between, I can see no abatement in the confidence of the people in her continued wealth and prosperity. Improvements, substantial as well as ornamental, have been made on every side, and in character and finish, are such as might put to blush many of the model cities in civilized countries, (as much as to acknowledge we are not civilized). Buildings of the most substantial character, with a considerable sprinkling of miners' cabins, and adobies, have been erected, and the better class of buildings are still going up, and already the city limits stretch afar up the rugged side of Mount Davidson. The streets are enlivened with fleets of schooners and quartz wagons, and groups of miners, speculators, hummers, Celestials, would-be politicians and Diggers, throng the streets, in the vicinity of whiskey mills especially, at all hours of the day. Mills and workshops keep up an incessant roar; the ring of metals, the hissing screech of the jack-plane, the thunder of the miner's blast and the rattling of rock down the chutes, resound throughout the mountains, and naturally lead one into moralizing on the wondrous changes that have taken place in this mountain wilderness, where but a few short years ago the Indian built his "wick-i-up" and rolled in the dirt by his camp fire, undisturbed by the hum of busy industry and the screech of the steam whistle. All is changed and changing, and who can foretell the future greatness of this embryo city, who can prescribe a limit to its progress.

Virginia is in many respects a model mining town, and the change from a barren and uninviting wilderness to a handsome city, thriving with busy, eager, craving life, is an incontestable evidence that man's energy will overcome all obstacles which natural barriers or the prejudices of the world may raise. The mountain falls off very gradually near its base, and here it is that the city is built. We first have numberless streets running parallel with the mountain, and built up closely. Farther up on the mountain side are the business streets, walled in by substantial fire-proof brick structures, with here and there a wooden building visible. Continuing up, we come to the hoisting works and ore houses of the mines on the Comstock, and, crowning all, are many handsome private residences, surrounded by grounds in which the fruits of horticultural labor are visible. Many of these cottages, with vines and shrubbery surrounding them, are really home-ified in appearance, and seem fit abodes for comfort, beauty, and love, if there is such a personage as the last named in this common place matter-of-fact country. In the architecture of the houses, extreme good taste is manifested. You see very few of those toppling upper stories so prevalent in other American cities, but, instead, a broad substantial base on *terra firma*, and, as a consequence, those nuisances of this enlightend age, innumerable and endless stairs, are done away with. 'Tis whispered the reason why houses are built so low here, is, because of the frequent and unceremonious visits of those delightful comforters which are honored by the soothing appellation of "Washoe zephyrs." However this may be, I like the custom, and I wish it were more generally adopted in other cities.

PECULIARITIES.

Like all American cities, Virginia has its *peculiarities*. The most noted of these is that characteristic of its people which will never allow them to do things "by halves." They have the best conducted newspapers, the most energetic fire department, the most comfortable and spacious—if not the handsomest—churches (sorry I can't say the same of the streets, hotels and theaters), the largest number of dens of dissipation, the greatest rogues, homelicst men—with few exceptions—dirtiest children and prettiest woman—myself excepted—to be found anywhere; in fact they are, in the fullest sense of the term, a "fast people."

BUMMERS AND BROKERS.

Then there are its bummers and brokers. I shall consider them as one class, for since the decline in "feet," circumstances of the pocket have made them indissolubly one. I am aware that your city is noted for its bummers, and I do not wish to detract from their hard-earned fame as a class when I affirm that, mighty as they are, they are nowhere in comparison to our bummers. Why, sir, they will neglect their important and pressing business engagements to dine with you. An invitation from you is not necessary. They will drink to your health innumerable times, and, to please you,—they always seem to know what will please you without enquiring—will call in all their brother bummers within hailing distance to do likewise; they will ride out with you to "show you the sights," treat your friends as if they had been on the closest terms of intimacy with them for years, and go home with you and make themselves perfectly at home in one minute and a-half by the watch, chuckling Matilda Jane under the chin, calling Euphemia "my dear," and addressing your wife as "Mary," occupying your easy chair, smoking your favorite Havanas, and, in fact, filling your place so well that you are almost convinced you are another individual; and so politely and so condescendingly is all this done, "merely to please you," that you consider it a favor and a pleasure to foot the bill, and never for a moment do you imagine that you have been most egregiously "sold."

The broker branch of the hummer class may be known by the dilapidated condition of their feet—the coverings thereof, I mean,—their seedy dress, unkempt hair and beard, and craving look at every display of bottles labeled "Old Bourbon." The smartest of them have turned politicians, and now spout for Honest Abe or Little Mac on the street corners, keeping one eye on the individual who is going to "treat" next, and the other on the face of any pretty girl or old woman who is so unfortunate as to come unawares within range of their impudent stare. They may always be found congregated around a free-lunch table, or lounging against a building where the sun is hottest; in fact the only time they can muster sufficient stamina to do anything is when it is necessary that the craving of their appetites should be satiated, or that they should move to keep in the sunshine. How have the mighty fallen!

A fact I have had sufficient evidence of during my stay here is, that the gentlemen have either not yet learned the first lessons in gallantry or they have forgotten them, for it seems to me that a great part of the male population have nothing better to do than to crowd the sidewalks and stare at the ladies, who are obliged to pass around them through the dusty streets, thus raising clouds of dust, greatly to their (the ladies') discomfiture, but to the extreme delight of the gentlemen(?), if we may judge from their gratified looks, grimaces and nods. For shame, gentlemen!

THE STATE OF NEVADA.

The telegram from the East announcing the admittance of Nevada as a State was received among us with general rejoicing. The roar of cannon echoed among our barren mountains, the old flag was thrown to the breeze from flagstaffs and house-tops, bonfires and fire-works blazed, and music lent its charm to the animated scene. 'Twas truly a gala night, for all seemed glad. We have again settled down into a staid and quiet people, though we do feel some additional pride over our newly got ten title and importance as a community—much the same as a school-boy experiences on donning his first long-tailed coat or a young man feels on his twenty-first birth-day, when he wakes up to the fact that he has stepped out from that period of his existence in which he was a "mystical something"—not a boy, and assuredly not a man—and during which the girls jeered him for being an overgrown boy, and aping the impudence and self-conceit of men, and the men knocked him around as if he were a thing of no importance, and thus took revenge because he would soon be a man with themselves. So with us. We feel that we are of some importance now. We have a deeper interest in, and a stronger love, if that were possible, for the old flag, for we are represented on its folds. We now have a voice in the affairs of the nation; we are no longer lookers on, but are actors in the great events which are transpiring daily, and which will be emblazoned on the pages of history for all time. Prosperity to the Silver Star of Nevada, the last and thirty-sixth in the Union galaxy! May she ever prove worthy of her place in the front ranks of patriotism and justice, shining with unsullied lustre through doubts and fears, discord and disunion! May her glory never be dimmed by any unworthy act, any lawless deed, any shirking of responsibility and of duty!

HARD TIMES.

Times are very hard at present among the laboring classes, much more so than many mere casual observers imagine, and many families are in actual want of the necessities of life, "Such is Life," while others are reveling in wealth and squandering in idle pleasure enough to make many comfortable, others—their neighbors perhaps—are starving and suffering. I feel so keenly when I see one of Poverty's children—and, Heaven knows, there are too many of them to be seen here—and how shameful this enlightened day, to have it said that he who can afford to give from his plenty is he who is blind to his fellow-mortal's sufferings. Truly is man's name inconsistency.

CAUSE—THE INJUNCTION MANIA.

The hard times are not caused so much by the stringency of the money market, as by the practice, which has resolved itself into a gigantic evil, of granting injunctions on mining claims and restraining enterprise on the weakest complaint made upon some fancied clash of titles, or imaginary wrong about to be done. This habit—for it is merely a habit, and is not founded on either good reason or good sense—has been the thorn in our side since we became a community. It has clogged progress, paralyzed enterprise and stayed the arm of development, and thus injured not only the vital interests of the State, but of the nation. Every branch of industry has felt its blighting influence, but the most injured has been and is that great motive power of our state—the mining and laboring class. Thousands have been thrown out of employment, are now idle by reason of its mandates, and are a dead weight on the energies of our struggling community. They have waited from week to week, hoping to find a change inaugurated, until they cannot remain longer and have not the wherewith to leave. Is there not just cause for complaint?

Public opinion is against this stretching of authority, this straining at law which permits a few individuals to paralyze the energies of a state, in the attainment of their own mercenary ends. It declared against it when it called on our former District and Supreme Judges to resign, and it will make it the test-question on which our Judges will be elected to-morrow.

I had intended to give you some gossip about our mines and mining interests, but my letter is already so lengthy that I will postpone it until my next. Floy Favorite.

Virginia City, Nev., Nov. 7th, 1864.

Found.—The dead body of a man, supposed to be one of the steamer Washoe victims, was found in Marin county on Sunday. A gold ring marked "P. M." was on one of the fingers.

Reese River Items.

We clip the following items from the Reese River *Reveille*:—

The prospecting business seems to be on the increase, and locations are more numerous than they have been for some time past. The locators have unlimited confidence in their claims, and in most cases commence working them immediately. Many of the mines pay all expenses and good wages from the surface, and we have known of instances where over sixty dollars per day have been made out of chloride rock. If the miners will only persevere in their efforts until spring, they will be certain to make money.

The Hildreth mill, since it has passed into the hands of Morgan & Muncey, has undergone many changes and repairs, and now ranks one of the best and most complete in the city. The proprietors will run it constantly during the winter. They are now having a large quantity of wood hauled to the mill and corded up. They intend to secure enough to last until spring.

A Remarkable Claim.—One of the most remarkable claims that has ever been discovered in this district, is located on the north side of Central Hill, in the Fourth Ward. It was located about three months since by Thomas Graham, and is owned entirely by him. He has had it worked ever since—sinking down from two to five feet, in different, places, and always obtained paying rock. He had twelve hundred pounds worked, from which he obtained $1,300, and choice lots have paid from one dollar to one dollar and twenty-five cents per pound. As soon as he gets all the paying rock from the surface, he intends to have an incline sunk, as the ledge is considered among the richest in the country.

Workmen are engaged in repairing the batteries at the Oregon Mill. New cams will be put in, and the stamps fixed thoroughly so that the mill can run constantly during the ensuing winter.

Paying Rock.—The Great Company are now, and have been for the last three months, working and developing their claim with great energy and success. A lot of quartz was sent to San Francisco recently, and assayed the enormous sum of $4,700 per ton. An English company advanced $3,500 on another lot and shipped it direct to England. This speaks well for our country and shows what our country is capable of doing if we only had the mills to crush the ore.

Proving Richer. The eastern extension of the Esther, near the Oregon North Star, is proving richer every day, and the owners are working it without intermission. They now have the main incline down to a depth of ninety-six feet, and are still sinking, taking out in the mean time very rich ore. They shipped 2,242 pounds of their choice rock, on Thursday, to San Francisco, but it is their intention to have it worked here, in future, if possible. A new and substantial house has been erected over the incline, which will protect the men at the windlass from inclement weather and make an excellent ore house. The proprietors are experienced miners, and deserving and industrious citizens, and we are truly glad to know that they have such flattering prospects for the future.

The Ravages of Insects a Cause of their Destruction.—It is well known that after worms have for five or six years committed their ravages on the trees of a region, they suddenly disappear, and have no full return for two or three or more years to come. It has been shown that the destruction is sometimes at least a result of their numbers. The larvæ or worms, when very numerous, consume the leavce of the tree on which they are before they attain full maturity, and, as a consequence, they never pass to the chrysalis state; they remain for a while as larvæ, often showing by their movements that they are half-starved, and then die.—*Scientific American.*

A Singular Plant.—Digitaline, discovered in 1830 by Le Reyer in the *digitalis purpurea* or foxglove, is a drug possessing an electric action on the pulsations of the heart, the vital functions of which it can stop entirely, thereby occasioning death. It is prescribed in very small doses for palpitation of the heart, but even then it must be used with caution, because it accumulates in the system, and the practitioner may sometimes be surprised at the sudden death of his patient even some time after he has left off the use of it.

An ignorant Dutchman passing a number of railroad tracks in the course of a day's journey, and never having seen any before, was nonpluseed to account for their use. At length after examining one of them for about twenty-five minutes, and scratching his head, he ejaculated, "Dey musht be iron clamps, to keep the ertquakes from breaking up der road."

The Chinese portion of Placerville was burned Sunday morning.

The Meerschaums of Fashion.

A man builds a house, and pays, in the first place, ten thousand more than he needs for a location in a fashionable part of the city, though the air will be closer and the chances of health less; he spends three or four thousand more on a stone front, on marble mantles imported from Italy, on plate-gluss windows, plate hinges, and a thousand nice points of finish, and has perhaps but one bath room for a whole household, and that so connected with his own apartment that nobody but himself and his wife can use it.

Another man buys a lot in an open, airy situation, which fashion has not made expensive, and builds without a stone front, marble mantles or plate-gluss windows, but has a perfect system of ventilation through his house, and bathing-rooms in every story, so that the children and guests may all, without inconvenience, enjoy the luxury of abundant water.

The first spends for fashion and show, the second for health and comfort.

Here is a man that will buy his wife a diamond bracelet and a lace shawl, and take her yearly to Washington to show off her beauty in ball-dresses, who yet will not let her pay wages which will command any but the poorest and most inefficient domestic service. The woman is worn out, her life made a desert by exhaustion consequent on a futile attempt to keep up a showy establishment with only half the hands needed for the purpose. Another family will give brilliant parties, have a gay season every year at the first hotels in Newport, and not be able to afford the wife a fire in her chamber in midwinter, or the servants enough food to keep them from constantly deserting. The damp, mouldy, dingy, cellar kitchen, the cold, windy, desolate attic, devoid of any comfort, where the domestics are doomed to pass their whole time, are witnesses to what such families consider economy. Economy, in the view of some, is undisguised slip-shod slovenliness in the home-circle for the sake of fine clothes to be shown abroad; it is undisguised hard selfishness to servants and dependents, counting their every approach to comfort a needless waste,—grudging the Roman Catholic cook her cup of tea at dinner on Friday, when she must not eat meat,—and murmuring that a cracked, second-hand looking glass must be got for the servant's room; what business have they to want to know how they look?

Some families will employ the cheapest physician, without regard to his ability to kill or cure; some will treat diseases in their incipiency with quack medicines, bought cheap, hoping thereby to fend off the doctor's bill. Some women seem to be pursued by an evil demon of economy, which, like an *ignis fatuus* in a bog, delights constantly to tumble them over in the mire of expense. They are dismayed at the quantity of sugar in the recipe for preserves, leave out a quarter, and the whole ferments and is spoiled. They cannot by any means be induced at any one time to buy enough silk to make a dress, and the dress finally, after many convulsions and alterations, must be thrown by altogether, as too scanty. They get poor needles, poor thread, poor sugar, poor raisins, poor tea, poor coal. One wonders, in looking at their blackened, emoldering grates, on a freezing day, what the fire is there at all for—it certainly warms nobody. The only thing they seem likely to be lavish in is funeral expenses, which come in the wake of leaky shoes and imperfect clothing. These funeral expenses at last swallow all, since nobody can dispute an undertaker's bill. One pities these joyless beings. Economy, instead of a rational act of the judgment, is a morbid monomania, eating the pleasure out of life, and haunting them to the grave.

Some people, again, think that nothing is economical but good eating. Their flour is of an extra brand, their meat the first cut; the delicacies of every season, in their dearest stages, come home to their tables with an apologetic smile—"It was scandalously dear, my love, but I thought we must treat ourselves." And yet these people cannot afford to buy books, and pictures they regard as an unthought of extravagance. Trudging home with fifty dollars' worth of delicacies on his arm, Smith meets Jones, who is exulting with a bag of crackers under one arm and a choice bit of an oil painting under the other, which he thinks a bargain at fifty dollars. "I can't afford to buy pictures," Smith says to his spouse, "and I don't know how Jones and his wife manage." Jones and his wife will live on bread and milk for a month, and she will turn her gown the third time, but they will have their picture, and they are happy. Jones' picture remains, and Smith's fifty dollars worth of oysters and canned fruit to-morrow will be gone forever. Of all modes of spending money the swallowing of expensive dainties brings the least return. There is one step lower than this—the consumption of luxuries that are injurious to the health. If all the money spent on tobacco and liquors could be spent in books and pictures, I predict that nobody's health would be a whit less sound, and houses would be vastly more attractive. There is enough money spent in smoking, drinking and overeating, to give every family in the community a good library, to hang everybody's library with lovely pictures, to set up in every house a conservatory which should bloom all winter with choice flowers, to furnish every dwelling with ample bathing and warming accommodations, even down to the dwellings of the poor; and in the millenium I believe this is the way things are to be.

In these times of peril and suffering, if the inquiry arises, How shall there be retrenchment? I answer, First and foremost, retrench things needless, doubtful and positively hurtful, as rum, tobacco, and all the meerschaums of divers colors that do accompany the same. Second, retrench all eating not necessary to health and comfort. A French family would live in luxury on the leavings that are constantly coming from the tables of those who call themselves in middling circumstances. There are superstitions of the table that ought to be broken through. Why must you always have cake in your closet? why need you feel undone to entertain a guest with no cake on your table? Do without it a year, and ask yourselves if you or your children, or any one else, have suffered materially in consequence.

Why is it imperative that you should have two or three courses at every meal? Try the experiment of having but one, and that a very good one, and see if any great amount of suffering ensues. Why must social intercourse consist so largely in eating? In Paris there is a very pretty custom. Each family has one evening in the week when it stays at home and receives friends. Tea, with a little bread and butter and cake, served in the most informal way, is the only refreshment. The rooms are full, busy, bright—everything as easy and joyous as if a monstrous supper, with piles of jelly and mountains of cake, were waiting to give the company a nightmare at the close.

Said a lady, pointing to a gentleman and his wife in a social circle of this kind, "I ought to know them very well—I have seen them every week for twenty years." It is certainly pleasant and confirmative of social enjoyment for friends to eat together; but a little enjoyed in this way answers the purpose as well as a great deal, and better too.

"Well, papa," said Marianne, "in the matter of dress now—how much ought one to spend just to look as others do?"

"I will tell you what I saw the other night, girls, in the parlor of one of our hotels. Two middle-aged Quaker ladies came gliding in, with calm, cheerful faces, and lustrous, dove-colored silks. By their conversation I found that they belonged to that class of women among the Friends who devote themselves to traveling on missions of benevolence. They had just completed a tour of all the hospitals for wounded soldiers in the country, where they had been carrying comforts, arranging, advising and soothing by their cheerful, gentle presence. They were now engaged on another mission, to the lost and erring of their own sex; night after night, guarded by a policeman, they had ventured after midnight into the dance-houses, where girls are being led to ruin, and with gentle words of tender, motherly counsel, sought to win them from their fatal ways—telling them where they might go the next day to find friends who would open to them an asylum and aid them to seek a better life.

"As I looked upon these women, dressed with such modest purity, I began secretly to think that the Apostle was not wrong when he spoke of women adorning themselves with the *ornament* of a meek and quiet spirit; for the habitual gentleness of their expression, the calmness and purity of the lines in their faces, the delicacy and simplicity of their apparel, seemed of themselves a rare and peculiar beauty. I could not help thinking that fashionable bonnets, flowing lace sleeves, and dresses elaborately trimmed, could not have improved their outward appearance. Doubtless their simple wardrobe needed but a small trunk in traveling from place to place, and hindered but little their prayers and ministrations."

Now, it is true, all women are not called to such a life as this; but might not all women take a leaf at least from this book? I submit the inquiry humbly. It seems to me that there are many who go monthly to the sacrament, and receive it with sincere devotion, and who give thanks each time sincerely that they are thus made "members incorporate in the mystical body of Christ," who have never thought of this membership as meaning that they should share Christ's sacrifices for lost souls, or abridge themselves of one ornament or encounter one inconvenience for the sake of those wandering sheep for whom He died. Certainly there is a higher economy which we need to learn—that which makes all things subservient to the spiritual and immortal, and that not merely to the good of our own souls and those of our family, but of all who are knit with us in the great bonds of human brotherhood.—*Harriet Beecher Stowe in the Atlantic Monthly.*

Financial Crisis in Europe.

If we except Russia, Prussia, Holland, and Belgium, a violent financial crisis is now raging in Europe. The two great western nations, France and England, are the most severely tried by that crisis, and, independently of the heavy purchases of silk and cotton made abroad, it must be attributed to some other causes, which are worth inquiring into.

Many great industrial enterprises, such as railroads, canals, etc., have been undertaken during the past twelve years in Russia, Turkey, Spain, Austria, and Italy; and those enterprises requiring hundreds of millions of dollars, have, for the most part, been carried on with English and French capital.

At the same time, great financial institutions, *credits* real and *mobilier*, international banks, etc., have been created in the above-named countries, also by the means of capital furnished by France and England. And while English and French capital emigrated to foreign lands, it could not help to promote and increase the national wealth. We believe that it is for want of an adequate capital that trade, industry and agriculture are suffering in France and England. They have exhausted all the resources which credit can afford—fictitious and real. And now that the bottom has been reached, it is apparent that France and England have miscalculated their strength, undertaken too much, and compromised their internal prosperity for the benefit of other nations.

Their public funds have steadily declined, while the rate of interest has increased—the best proof that the disposable capital has decreased, and that the savings accumulated by successive generations have been exhausted. At the same time, breadstuffs and all the necessaries of life have reached higher prices, so as to render living a very expensive affair; and the fact has been again demonstrated in the history of nations that their real wealth consists in an increasing production of all the necessaries of life. When that production is such that living is easy and the people contented, they may apply themselves to the study of science and the advancement of art and civilization. There is more truth than appears at first sight in the old Latin axiom: *Mens sana in corpore sano.*

The emigration of capital from France and England, for the causes we have enumerated, is certainly the principle source of their financial difficulties; and it is by curtailing their army and navy expenses, that they will be able to weather the storm, which has been brewing during the past few years, through the rashness and want of forecast of their statesmen and capitalists.—*N. Y. Stockholder.*

Meteoric Gems.—We have seen many specimens of meteoric stones, but never, until recently, any which could be considered as gems. We have now in our drawer one of several similar specimens collected by Dr. A. W. Hall, of this city, in the South Park, Rock Mountains, 100 miles south of Denver City, Colorado Territory, of a kind of stone which is quite new to us. It is almost transparent and of a pale blue color, but shows faint flashes of yellow in a strong light, and bears evident marks of having been in a state of fusion. It was found upon the surface of ground which had never been trodden by the foot of man, and from the fresh and clean appearance of its surface could not have been dropped many days or weeks before it was discovered.—*American Artisan.*

The Southern Mines. The Los Angeles News of the 13th, says: It is reported that miners are flocking into the gold placers at Little Creek, San Bernardino county, in large numbers. Soledad, Rosa City, as we learn, has been almost entirely depopulated; all are leaving for the new mines above mentioned. A large proportion of the miners have also left the El Paso and other mining districts north of this place. It is stated that all claims which have been opened are yielding richly, sixty to one hundred dollars a day have been taken out by two men on more than one occasion.

California Newspapers.—The State of California can boast of some of the best newspapers in the United States. There are not only many excellent journals of general and commercial intelligence, but some devoted to agriculture, others to mining, and others to literature. The *Mining and Scientific Press*, published weekly in San Francisco by Messrs. Dewey & Co., and devoted to mining, science, and the mechanical arts, will compare favorably with any paper of its class in the country. It is a handsome sheet of sixteen pages, well edited and printed, and it contains a great variety of valuable information.—*American Artisan.*

The oil excitement in West Virginia, below Wheeling, is having a great run. The Intelligencer says that on Horse Neck, Freach and Cow Creeks, there are nearly a thousand wells in progress. Not one in twenty has proved a success.

What I have Noticed.—I have noticed that all men speak of men's virtues when they are dead; and that all tombstones are marked with epitaphs of good and virtue. Is there any particular cemetery where the bad men are buried?

I have noticed that the prayer of every selfish man is "forgive us our debts," but that he makes everybody pay who owes him, to the utmost farthing.

I have thought that death is a merciless judge, though impartial. Every man owes a debt. Death summons the debtor and he lays down his dust in the currency of mortality.

I have noticed that he who thinks every man a rogue is very certain to see one when he shaves himself, and he ought, in mercy to his neighbors, surrender the rascal to justice.

I have noticed that money is the fool's wisdom, the knave's reputation, the wise man's jewel, the rich man's trouble, the poor man's desire, the covetous man's ambition, and the idol of all.

I have noticed whatever is right—with few exceptions—the left eye, the left leg and the left side of the plum pudding.

I have noticed that merit is always measured in the world only by its success.

I have noticed that as we are also always wishing instead of working for fortune, we are disappointed, and call Dame Fortune blind; but it is the very best evidence that the old lady has capital eyesight, and is no granny with green spectacles.

I have noticed that purses will hold pennies as well as pounds. I have noticed that tombstones say, "Here he lies," which is no doubt often the truth; and if men could see the epitaph their friends sometimes write they would surely believe they had got into the wrong grave.

Increased Explosiveness of Mining Powder.—Mr. Nobel announces that by dumping mining powder with nitro-glycerine its explosive power is trebled, and the noise of the explosion much less than when ordinary powder is used. Glycerine belongs to that class of organic substances in which one or more equivalents of hydrogen may be replaced by an equal number of equivalents of nitrous acid. It is this substitution which changes cotton into gun cotton. The change carries into the compound a quantity of oxygen which on the application of heat enters into combination with the other elements so rapidly that the action is explosive.

How to Judge the weather by the Sky.—The colors of the sky at particular times afford wonderfully good guidance. Not only does a rosy sunset presage fair weather and a ruddy sunrise bad weather, but there are other tints which speak with equal clearness and accuracy. A bright yellow sky in the evening indicates wind; a pale yellow, wet; a neutral grey color constitutes a favorable sign in the evening, an unfavorable one in the morning. The clouds again are full of meaning in themselves. If their forms are soft, undefined and feathery, the weather will be fine; if the edges are hard, sharp, definite, it will be foul. Generally speaking, any deep, unusual hues betoken wind or rain; while the more quiet and delicate tints bespeak fair weather. Simple as these maxims are, the British Board of Trade has thought fit to publish them for the use of sea-faring men.

A Recent Fall of Manna.—Sir Roderick Murchison has been informed that a fall of manna has recently taken place in Asia Minor. This manna is a lichen which is formed in the steppes of the Kurghie, and is often carried in these falls far to the west, across the Caspian. The grains, which are always perfectly detached, have much of the form of a raspberry or mulberry, and are found frequently to be attached to a stony support of granite, sandstone and lime. This manna is ground into flour, and baked into bread, and is known among the Turks by the name of "kerdercoghdasi," which means wonder-corn or grain.

Test of Death.—When fire is applied to a living body a blister filled with liquid is soon raised, and if the heat be continued, the epidermis is destroyed. But when the same heat is applied to a dead body, the epidermis rises in the form of a blister, which is filled with vapor, and which presently bursts. The test has been proposed by M. Martin de Courdoux, to ascertain if a person be really dead before the burial. In performing the test the author recommends a small flame, such as the flame of a match, to be applied for a short time at about half a centimetre from the skin.

A new style of veil is coming into favor with young ladies. It is made in the fashionable black and white figured lace, with a fine elastic run through the upper part, which fits to the edge of the bonnet. A second elastic runs through the lower part of the veil, a short distance from the bottom which fastens it under the chin, giving the effect of a street mask, transparent and very coquettish.

City Stock Reports---San Francisco Stock and Exchange Board.

From the "Weekly Stock Circular" of the Associated Brokers.

San Francisco, Saturday Morning, Nov. 12th, 1864.

The excitement attending the election, and the adjournment of the Board for one day, restricted operations during the early part of the week, but since then the market has exhibited more animation, and large transactions have taken place in a number of shares. The market for most leading stocks evinces stability, and a good feeling prevails among dealers. More confidence is felt in the permanence of these miaes, and recent developments would seem to warrant this faith in their future productiveness. A number of claims hitherto largely in debt will soon be in a condition to cancel all their liabilities, and may also disburse something to stockholders on or about the first of January. This addition to the list of dividend-paying stocks will have a beneficial influence upon the market.

Receipts of treasure from the interior since Saturday last amounted to $1,100,000.

Gold bars are selling at 840, and silver bullion ranges at ½ to 3 per cent. premium.

The money market continues abundantly supplied with capital, and most parties meet with no difficulty in borrowing upon good stock, collateral at 1½@2 per cent. per month. Leading shares are in much more favor with capitalists.

Savage was offered at the close at $1,825, and small sales have taken place during the week at $1,800. In drifting to the westward from the lower level, a distance of seventy-five feet from what is known as the North Potosi chimney, a large body of fine ore was reached a few days since. The company are now hoisting some 150 tons daily, and are supplying the Central Mill with first-class ore, averaging about $200 per ton. Receipts of bullion so far during the month are large, and the surplus in the treasury has materially increased.

Gould & Curry has been in less favor, and declined from $1,400 to $1,325, then quickly rallied, and sold yesterday at $1,400. Receipts of bullion so far this month are up to the usual average of about $7,000 per day.

Yellow Jacket was sold at $1,000, buyer 30, and $950 cash, and closed at $955 bid, $1,000 asked. In sinking upon the vein in this mine at a depth of some 310 feet, the rich seam of ore has attained a width of some twelve feet. Other portions of the lode also contain fair milling ore. The company are extracting about 50 tons daily, a portion of which is reserved for shipment to Europe.

Chollar has been actively dealt in, and 30 feet were sold, advancing to $1,075, buyer 30, receding to $985, regular way, rallying again to $1,050, buyer's option, then selling at about $1,000, and closing at $1,000. The upper stope in the south mine is said to be looking well, and the quality of ore found to improve as work progresses in the new galleries now being opened. The lode at this point continues to hold out as the drift proceeds to the southwest. The new reels will be in operation in a day or two, increasing the hoisting capacity of the company to 150 tons daily. Some 30 tons of good ore are now daily taken from the north mine, and a number of additional mills are to be at once employed. All the ores crushed are now paying well.

Hale & Norcross has been in decided request this week, and 49 feet were sold, quickly advancing from $525 to $800 and $1,000, slightly receding to $980, and closing yesterday at $945. A very promising body of good ore has been found this week, about 85 feet north of the Chollar line, in drifting southeast from the 500 feet level. The lode at this point, thus far, is some 16 feet in width, and its character is said to improve as the cross-cut continues. Drift No. 7, at 543 feet level and 50 further north, is also beginning to disclose pay metal.

Crown Point is well maintained at the recent advance, and small sales have been made at $750@760 per foot, buyer 15 days. The prospects of this company are said to be flattering.

Empire Mill & Mining Company is inactive, but strongly held at about $575. The company's two mills are now reducing about 45 tons daily. The mine is, however, producing some 75 tons per day, and a reserve of about 1,500 tons has already been accumulated. The working capacity of one mill is soon to be materially increased. Most of the ore is taken at present from the third level, at a depth of 445 feet. After the payment of the last dividend of $25 per foot, a surplus of more than $20,000 remained at the credit of the company.

Ophir is regarded with rather more favor and 18 feet were sold, advancing from $425 to $440, and closing at $460 bid, $465 asked. The Company's new mill on the Carson River is now making full time and crushing some 30 tons of ore per day. A large body of water in the main shaft will temporarily suspend operations in this portion of the mine.

Imperial is inactive but firm, small sales were made at $147½ per share, and at the close $148 was bid $150 asked. The yield of the mine for the month of November will, it is thought, exceed that of last month.

Uncle Sam was sold at $180 per share. Overman is offered at $130, and Alpha has been inquired for at $350. Belcher is in request at $700.

Bullion rose from $135 to $145, fell to $137½, advanced to $157½, and sold yesterday at $200. Within this range 245 shares were dealt in.

Sheba is in less favor and some 20 feet were sold at $53. The Company received a shipment of $4,000 in bullion this week.

Burning Moscow has continued to be a feature of the market, and 2,683 shares changed hands, opening at $28, advancing to $43, buyer 30, receding to $38, rising to $46, declining to $43½ and selling yesterday afternoon at $46.

Nevada, J. G., is in better favor and rose from $32, seller 30, to $37, closing at $35, seller 30. The assessment of $10 recently levied will, it is thought, cancel all indebtedness and leave some $12,000 in the treasury of the Company.

Bajazet & Golden Era advanced from $19 to $25. Pride of the West was sold at $7 and $8. North American at $40. Baltic at $18 and $20. Daney at $22, and Caledonia Tunnel at $9½ and $10.

Josephine, (Copper) is in request, and sold yesterday at $50. Active operations have been resumed, and two drifts are in progress from the main shaft, at a depth of 187 feet. The Company's prospects are thought to be flattering. Antelope is in much better favor, and at the close $100 was bid.

Golden Age & Empire was dealt in at $14. Wide West declined from $23½ to $18½, and closed at $16 bid.

State Telegraph was sold at $38, and California Steam Navigation at 75. Spring Valley Water Company is enquired for at 45.

Legal Tender Notes have been actively dealt in, $70,000 were sold within the range 42½ seller 30, and 45 flat, 60 days. At the close 46 was bid.

The aggregate sales since Saturday last amount to $330,970.

Sales of Mining Shares

Authorized Scale of Commissions Adopted by the S. F. Stock and Exchange Board.

Miscellaneous.

Funded Debt, on par	½ per cent
Insurance Stocks, on par	½ per cent
Wharf Stocks, on par	½ per cent
Gas Stocks, on par	½ per cent
Railroad Stocks, on par	½ per cent
Steamboat Co. Stocks, on par	½ per cent
Telegraph Co. Stocks, on par	½ per cent
Water Co. Stocks, on par	½ per cent
Legal Tender Notes and Bonds, on par	½ per cent
Bills of Exchange, on net amount	½ per cent
Mint Certificates, on net amount	½ per cent
Specie, on net amount	½ per cent

Commissions on Mining Shares.

Sale at 1 dollar up to 10 dollars	$0 25 per foot
Sale at 10 dollars up to 25 dollars	50 per foot
Sale at 25 dollars up to 50 dollars	1 00 per foot
Sale at 50 dollars up to 100 dollars	1 50 per foot
Sale at 100 dollars up to 200 dollars	2 50 per foot
Sale at 200 dollars up to 400 dollars	5 00 per foot
Sale at 400 dollars up to 600 dollars	6 00 per foot
Sale at 600 dollars up to 800 dollars	7 50 per foot

From $800 to $3,000 per foot, one per cent, on the amount of purchase or sale.

Anything above $3,000 per foot, three-quarters of one per cent. on the amount of purchase or sale.

FRANK LAWTON, Secretary. J. B. E. CAVALLIER, President.

Mechanical.

Cleaning Oil-Stones.—A correspondent of the American *Artisan* gives the following recips for cleaning oil stones and hones:—"Take potash, or pearlash, or saleratus, or borax, or any other alkali, and put from half an ounce to an ounce in a half pint bottle, fill with soft water and cork and keep for use. When wanted pour as much upon the stone as will spread over the same, and let it stand until the oil is 'ent,' then wash off. Try it, and you will be able to hone as well as when the stone was new." It is well known that oil-stones become fouled after a little use, and no "grit', is observable, although the best oil may may be used. The steel which is cut off by use gives the oil a drying property, which fouls the stone; after which it takes twice the time to set the edge of an instrument that is required to clean off the stone and renew the oil. Water will not unite with grease, but it often happens that water-stones become fouled with oil from use. The alkali, applied as above, unites with the oil, a soap is the result, which can be washed off with clear water, and the fresh oil or water applied.

A Mechanical Query.—When a wheel is rolling along the ground, the upper portion moves more rapidly, in relation to the earth, than the lower, so that the motion of every portion of the wheel, except the center, undergoes a series of changes in velocity during every revolution. This fact has suggested two mechanical queries which are propounded by the *Scientific American* as follows:

First.—Do these changes in the velocity of the several parts have any tendency to check, through the action of inertia, the onward rolling of the wheel?

Second.—Do the changes have any tendency to alter the form of the wheel; and if so, in what way?

Elasticity of Cast Iron Cannon.—The elasticity of large cast iron cannon, according to the London *Artisan*, was recently pretty well demonstrated in the trial of one of Blakely's 11-inch cast iron guns, hooped with *steel*. During the trial one of the steel hoops was *broken* by the expansion of the gun, while the gun to all appearances remained uninjured. Another hoop was placed upon it, and the gun submitted to further and most severe trial without manifesting any sign of strain or damage from the trial which broke the steel hoop. The gun was fifteen feet long and forty-three inches in diameter.

New English Steam Engine.—An English Lieutenant has just invented a new style of engine which is designed to be exceedingly compact and simple in its details. It is merely a cylinder fitted with a very deep piston. This piston has a cylinder inside of it, running at right angles with the bore of the main cylinder. There are two pistons in this cylinder which connect by rods to a crank shaft running through the large cylinder. The deep piston also connects to this crank shaft, so that when it has made one stroke, carrying the crank shaft part of the stroke, the small cylinders in the main piston act on the crank shaft, and also impel it. The whole engine is no larger than the cylinder, everything being enclosed in it. Steam is used on the smaller cylinders first, and then let into the larger one.

Method of Making Cast Steel.—Mr. Clay Gazalat has communicated to the Academy of Sciences at Paris, that by passing through fused cast iron at 1400 degrees centigrade, numerous capillary jets of superheated steam, he is enabled rapidly to remove the carbon which is taken up by the hydrogen of the decomposed water, and also to burn out, by the oxygen liberated from the water, the silicon, while the sulphur, the arsenic, and even the phosphorous are removed in combination with the hydrogen. Should this prove to be so, we may have an auxiliary to Bessemer's method, at least, and possibly even a substitute for it.

A company in London has bought one hundred and forty acres a few miles from the city, and purpose to enclose it with glass, making a climate like that of Maderia, with the fruits and foliage to be found in that isle. A hotel and residences are to be built, and great prices will be charged for a chance to live under glass.

The Largest.—The largest bell in America is supposed to be the one hung in the tower of the Catholic Church in Cincinnati.

The Hand Quartz Mills in Reese River.—We clip the following with regard to the hand and horse quartz mills, at Austin, from the Reese River *Reveille*:—Some few of our citizens have censured us severely for advocating and recommending the use of horse and hand mills, and hand mortars, for the purpose of crushing ore; and some went even so far as to say that we were encouraging petit larceny, as many of the persons who were engaged in the business did not have claims, or sufficient means to purchase the rock. Now, so far as countenancing or encouraging pilfering is concerned, we deprecate it as much as any one; but, on the other hand, if a man will steal, we should much prefer that he would steal the rock, get the silver out of it, buy his provision, and put the money in circulation, than to steal the necessaries of life. In the former case he is a producer, and the latter makes him a worthless consumer altogether. But it does not follow that to make a hand-mill pay, a person must "Jayhawk" the rock. There are hundreds of claims in this city and vicinity that are abandoned, not because they were not rich, but simply because the owners did not have the means necessary to work them. From these claims an abundance of ore can be obtained to run all the hand mills that will be started here for ages. Three months since there was not a horse or hand mill in the city, and but few hand mortars used. Now there are over *thirty* of the former in successful operation, the latter having gone almost entirely out of use. From Mr. Salmon, the inventor of the new amalgamator, we learn some interesting facts. He is engaged in amalgamating exclusively for the horse and hand mills, and does it with one of his tubs by hand power. He takes out over $500 a week, but finds it impossible to do all the work that is offered him. The bullion all runs over 900 fine. Four gentlemen for whom it has been working took out sufficient after night, in hand mortars, to keep them in provisions and develop their claim, and they are now having a large lot worked at one of the steam mills. Another, who was on the eve of leaving here in despair, went to work with a hand mill, and has taken out enough to send for his family in Wisconsin, besides having sufficient means to last him the ensuing winter. Mr. Salmon knows of many good and experienced miners who would have left the country, but who, by these minature inventions, have been enabled to "stick it out," work their claims and help to develop our wonderful and most remarkable mines. There is at least two thousand dollars per week of bullion taken out by these mills, and it is constantly increasing. They keep many men employed, to assist in developing a number of mines, and put many dollars of our buried wealth into circulation; besides, it makes all engaged in the business thorough and experienced millmen. For these and many other reasons that we could give, we favored and still favor the introduction of these mills.—*Reese River Reveille.*

What is an Engineer.—He is neither a pedant, however profound, nor a visionary empiric, however ingenious, nor a mere mechanic, however dexterous. Engineering consists in the adaptation of the forces of nature to the wants of human society—the word adaptation being used in the wide senses of directing, preparing and producing. These forces of nature are recondite and complicated, and, although that inquiring animal, man, has been face to face with unchanging nature for thousands of years, he has not been able to wheedle all her secrets from her. Science, however, such as it is, is the human practice of generations and generations: it is the knowledge power latent in the life-span of a single individual multiplied many thousands of times. The self satisfied empiric, or the mere operative, who rejects that accumulated labor called science, shows a narrow-minded ignorance which is only equaled by the learned man who fancies that everything can be done by mathematical calculation. Much more could be done by theory if theories were complete, but science, in its present state, is only imperfect, and requires to be bound together for every-day use by every-day practice. And the imperfection of man's individual powers will never allow what is termed practice to be dispensed with, while an ounce of mother-wit will always be worth more than a ton of school-wit. We may thus define an engineer as a man more or less gifted with the constructive and philosophical faculties, furnished with a sound education in the modern sciences, and one who has passed as much, or more, preparatory time in the workshop as in the lecture-room.—*London Engineer.*

Franklin was once asked, "What is the use of your discovery of atmospheric electricity?" The philosopher answered the question by another. "What is the use of a new-born infant?"

An elegant meerschaum clay has been found in an old red sandstone quarry at West Bardnill, Scotland, which will rival the German.

New Material—Paper Ships and Paper Guns.

The London *Observer* describes a new preparation of paper of a remarkable character. The uses to which it may be applied were explained on the the 13th of August, at the Phœnix Works, Battersea, as follows:

There were tubes made of paper which had been tested in the most satisfactory manner as rocket tubes. Being made of paper they are, of course, very much lighter than the ordinary iron tubes, and they stand the test of rocket firing equally as well as those made of metal. Not less remarkable were the thick slabs and boards made of paper. These boards, of one inch in thickness, had been tested by bullet and ball, and the results showed that their power of resistance was equal to ten inches of solid oak. The bullet, which had passed so far through the paper board as to cause a projecting surface at the rear, would have gone clean through the oak, fracturing and tearing it in all directions, while in the paper board the perforation was a small, clean, round hole. These paper boards are admirably adapted for the sides of ships; their specific gravity is somewhat less than that of oak, and they are easily fixed to the framework of vessels. They have, however, this additional advantage over timber—they do not require copper-sheathing to prevent fouling, they are non-absorbent, and neither animal nor vegetable life flourishes upon their surface, as is the case with timber and iron. They have also this further advantage that they are incombustible. No amount of heat will set them in a blaze. The application of great heat will produce combustion in the immediate neighborhood of the flame, but anything like ordinary burning is quite out of the question. In addition, however, to all these good qualities, paper has positively the advantage over timber and iron in the matter of cost.

M. Szerlemy, the inventor, well known for the successful manner in which he has arrested the decay of certain portions of the exterior of the houses of Parliament, has discovered a fibre which grows in the southern portions of Germany, and which may be converted into a rough kind of paper at a cost so trifling as to enable him to compete with the builder of timber and iron ships. Not content, however, with forming the sides of ships of paper, the inventor is now engaged in the construction of light field pieces, specially adapted for mountain warfare, and these, judging from the results already obtained by experiments with paper tubes, will be found to answer the purpose admirably. Tubes have already been formed of this prepared paper, and they have stood the test against iron in the most satisfactory manner.

So far as we were enabled to ascertain the process of manufacture, it consists of lapping sheets or rolls of paper, moistened with a solution of which zopissa is the principal ingredient, one over the other, until the requisite degree of thickness or strength is attained, and exposing the material for a short time until it becomes thoroughly hardened. This zopissa is of the nature of a gum, and is found in considerable quantities in Egypt. It has the peculiarity of giving extraordinary hardness to any surface upon which it is placed, and it was very extensively used in the preparation employed for preserving the stone in the exterior of the House of Commons. It has also been used for the exterior of the Bank of England, the interior of the dome of St. Paul's, on which Mr. Penrose has painted his frescoes, and it has just been applied with extraordinary success to the arches of the London, Chatham and Dover railway, at the Elephant and Castle station, which has lately suffered considerably from damp and the infiltration of water from the roadway.

There appears to be no limit to the application of this useful material. In addition to the preservation of paper, linen, stone, brick, plaster, and other material, another almost as useful application of this article was shown in the perfection of a material resembling flock paper, and suitable for carpets, which can be prepared of any color and with endless variety of pattern. A slight alteration in the mode of treatment converts canvas into a description of oilcloth which will stand any amount of wear, as may be seen from some pieces which have been for several months laid down in the workshops at Battersea. The materials of a house are now in course of construction, for the purpose of showing the adaptability of the paper boards to the construction of emigrant's houses, temporary churches and barracks. Already large quantities of a material known as 'Panouia,' or leather cloth, is manufactured by the use of this extraordinary substance, and made up into boots and shoes, which rival in their durable qualities the best kinds of leather.

Gold Test.—A good test for gold or silver is a piece of lunar caustic, fixed with a pointed piece of wood. Slightly wet the metal to be tested, and rub it gently with the caustic. If gold or silver, the mark will be faint; but if an inferior metal, it will be quite black. Jewellers who purchase old gold often use this test.

Complimentary to American Inventors.

No people are so full of ingenious little expedients for saving labor and material as are the Americans. The force of circumstances has made the Yankee a master in the art of extemporizing little "dodges" in mechanism. Self-help is the great lesson a man receives when he sets foot in a new country, and it is in the invention of helps in metal and wood—helps which need no wages, and which never strike, or tire, or grow sick—that the New Englander excels.

There is nothing outside of a pantomime more ludicrously clever than some of the inventions which have of late years been introduced into this country from the West. The process of making common pails by machinery is so rapid as to baffle the eye, and so comically instantaneous that the stranger who witnesses it for the first time laughs over it as a most excellent practical joke. There is a whizz of revolving wheels, a spatter of light shavings, a procession of little staves chasing one another in the air, then another whizz of the collected staves, and the bucket is hooped and made. Scarcely less amusing is the little mechanical device for paring apples by machinery. The machinery is the veriest toy—simple and cheap—but it brings off the rind with an almost magical delicacy, and while it pares the fruit with an accuracy which seems to bespeak a special sense of touch, it slices the apple and takes out the core at the same time.

Success in such small matters has made the American bold, and has trained him to habits of innovation. So far from dreading novelty, he likes novelty for its own sake, and to secure it, he often reverses our way of doing things. In his steamboats he builds up the cabins tier over tier upon deck, instead of below, and he suffers the engine to work high in air above the many stories of cabins. When he wants to put another story to a great building he adds the new floor at the bottom instead of at the top; and be it a bank, hotel or huge store, he is ready at your command either to lift the entire block or to slide it on its travels to a more eligible location.

In printing newspapers, he builds his type upon cylinders instead of laying it upon the slow-working table, and he makes the machine pick up and take off its own printed copies with a regularity and neatness which no number of trained hands can equal. His gunboats are floating martello towers, that can fire fore and aft as readily as from the sides. His river steamers are amphibious, and may go anywhere where it is a little damp. He is partial to machinery, because it does not grumble, is not impudent, is not extortionate; and hence it comes that his crops are gathered with patent reapers, his linen is washed with wooden hands, his cows are milked by the patent cow-milker, his potatoes as well as his apples are pared by one of the queerest little steel kitchen-maids, who has no "followers," and who wastes none of his fruit; and even his chairs, his tables and his cabinet work in general come from manufactories large as our cotton mills, where they are turned out in parts by swift-moving machinery.—*Dundee (Scotland) Advertiser.*

A New Coloring Matter—deep purple—said to be extracted from sugar, under the name of Avelia and costing $25 per gallon, has recently been introduced into London. It is pronounced by the proprietors a magnificent color, equal to the finest Anilines. The price is, however, very high, and, unless its superiority to the favorite Mauve of the Aniline group can be positively shown, it will stand no chance of adoption by the dyers. There is no limit to the discoveries that may be made in this line of inquiry. The Anilines hold a royal rank. All efforts at improvement on them, so far, have been abortive. Aniline is commonly spoken of as made from coal tar, from which it was originally obtained; but it is now obtained from benzole, which is only one of the sixty odd products of the distillation of coal. There are many varieties of these colors, and several of them of remarkable brilliancy. Their manufacture is carried on to some extent in this country, but the chief source of supply for the American market is Great Britain. There is room here for American talent and enterprise, that we hope will find its way into the mysteries of Aniline, and work out for our dyers an independence of all foreign manufactures.

A New Brick for Garden Walls.—Mr. Foxley, of Stony Stratford, England, has invented a new brick, ingeniously contrived, for avoiding the necessity of nailing for training trees to garden walls. The brick has a projecting bead in the center of the face, which is drilled with holes so as to admit the passage of a piece of string or bass, with which the branch may be tied. One advantage of the head is that it admits of a free circulation of air between the plant and the wall, preventing the formation of mildew and rot, and the accumulation of insects. The cost is said to be little more than that of an ordinary brick.

It is Impossible for editors to know ALL the merits and demerits of their correspondence, consequently the reader must not receive the opinions of our contributors as our own. Intelligent discussion is invited upon all sides and the evidence of any error which may appear will be received in friendship and treated with respect.

American and Foreign Patents.—Letters Patent for inventions can secured in the United States and foreign countries through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past year.

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the MINING AND SCIENTIFIC PRESS, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

San Francisco:

Saturday Morning, Nov. 12, 1864.

THE GRASS VALLEY MINES.

In our last we made quite a full notice of some of the recent discoveries and developments in what is known as the "New District," situated to the east of the town. We made that notice from personal observation, and intended to have made an equally thorough examination of the older mines located to the south and west of the town, during our stay in that place, but other engagements so occupied our time that we were unable to do so, and we are compelled to content ourselves with a mere "brief mention" from observations previously made and more recent information derived from oral communication, with parties interested or acquainted with the mines.

The Gold Hill mill, one of the oldest and most noted establishments of the kind in Nevada County, is still pounding away at custom work, and daily turning out large quantities of bullion. This mill is not connected with any particular mine, but is employed exclusively as a custom mill. It is now chiefly engaged in crushing rock for the Lucky Company, for which it is taking out about $4,500 per week. Below the Gold Hill we have Rush & Laton's mill, and that known as the French mill. Both of these mills appear to be kept pretty busy. The Empire Mill, in this neighborhood, has been idle for some time, the engine having been taken out of it to be placed upon another locality. The property has recently changed hands, another engine has been procured, and this old pioneer mill will soon be again in operation.

MASSACHUSETTS HILL. This famous mine, owned by the Messrs. Watt, O'Keefe & Co., still keeps up its ancient reputation as one of the most valuable mines in California. We have no means of knowing the amount weekly taken out of the mine. It must be large, however, judging from the heavy investments which the Messrs. Watt are making in real estate in this city. They afford constant employment to about three hundred men, and are crushing regularly. The huge piles of debris which have accumulated about the works of this mine fully attest to the immense amount of work which has been done in it. The capacity of their mill is entirely disproportionate to the amount of rock which they are now raising. The company has fully 3,000 tons of rock ahead, every ton of which is rich enough to leave a large margin for profits.

SCADDEN & Co., who are working the extension of this lead at a point where it crosses the ravine just east of Watt's mine, are also doing as well as ever, and are taking out large amounts of rich and valuable rock.

NEW YORK HILL, which, for a long time, has remained comparatively idle, is about to again become a scene of bustling activity. Several Grass Valley capitalists, among whom we may mention Messrs. Loutsenheizer & McLaughlin, are about to commence active operations in that locality.

THE ALLISON RANCH MINE is still being worked with the same extraordinary success which has for several years attended the operations of the fortunate proprietors of this famous gold mine.

FOREST SPRING COMPANY. The lodes belonging to this company are among the oldest worked mines in Grass Valley. The company now consists of Mr. C. T. Wheeler of Sacramento and Mr. F. E. Corcoran of this city. They have a 10-stamp water mill, but have been unable to operate it more than eight or nine hours out of the twenty-four for some time past, in consequence of the unusual low stage of water, in Wolf Creek, upon which it is located. There are three lodes belonging to this company, one of which, the Norumhagun (hill of tall pines) is now opened and being thoroughly worked to a depth of 540 feet on the incline. Ore is now being taken out from four galleries. This mine has been worked for eight years, and is paying better in the lower gallery than at any point above. Fifty-four men are employed in the mine and mill, and about 200 tons of ore are raised every month. The last average yield was $51.80 to the ton. This mine is freed from water and the ore is raised by means of a double engine.

The famous Lone Jack is also owned by this company. Work upon this vein has been suspended for some time, in consequence of a law suit, which has been decided in favor of this company, who have now resumed operations again. They are pumping out the mine, and will be ready to raise rock in about sixty days. They have an incline 530 feet deep, at the bottom of which is their lower gallery. This has always been known as a very rich mine, and is found, like all other mines in this district, richest at the lowest depth opened. This is supposed to be on the same vein as the Allison Ranch. The expenses of this company are from five to six thousand dollars per month, and the gross receipts reach from eleven to thirteen thousand.

THE FRENCH OR LAFAYETTE LEAD, which a few years ago was sold for a small sum, has recently redeemed its early fame and is now once more classed among the richest of the Grass Valley mines. The mine is now in the hands of several experienced Cornish miners, who have recently gone down much deeper than the old workings, and by their enterprise have thus secured fortunes for all.

THE EMPIRE COMPANY, one of the oldest incorporated companies in Grass Valley, has recently passed into the hands of San Francisco capitalists, and is now under the controlling direction of Capt. Lee, of this city. Work had been suspended for a time at the mine, although the mill has been kept running on custom work. Capt. Lee has recently commenced pumping out the mine, and will be ready to take out rock next month. We understand that he intends to go down still deeper, in the confident anticipation that this, like all the other mines in that section, will improve in depth, in a ratio much faster than the increase of expenses for deep working.

We have already alluded to the enterprise of Mr. Woodworth, at Osborn Hill, and shall take the earliest opportunity to advise our readers of the success of the new method of working which he is about to introduce. It is worthy of remark, in this connection, that no mine in Grass Valley, has ever been prospected to any considerable depth below the water line without meeting with most satisfactory success.

REESE RIVER BULLION.—The amount of crude bullion received during the month of October by Theall & Co., of Austin, was 57,000 ounces. This firm is but one of three or four, in that place, which are constantly receiving bullion for melting and shipment.

RE-BUILDING.—The Woodpecker Mill, lately destroyed by fire, situated a short distance from Dayton, Nevada, is being rebuilt. The frame of the new building is up, and already roofed and enclosed.

STILL PETERING.—During the past three days, says the Virginia *Union* of the 5th inst., Wells, Fargo & Co. have shipped in bullion, from this city, $118,255.21. It's a pity about Washoe!

PETROLEUM AND ITS USE.

No better idea of the immense importance and the growing value of the petroleum product of our country can be given than the simple fact, which is stated as such in the *Scientific American*, that the amount of this product in the State of Pennsylvania, during the past twelve months, has exceeded the total product of the iron and coal mines of that State by five millions of dollars. The yield of petroleum is set down at $56,000,000, while that of iron and coal has been only $51,000,000. The value of the several products has been taken at the mine.

Late discoveries have shown that petroleum is more generally distributed throughout the world than coal. There are large ocean tracts where coal cannot be procured for steam navigation, but where it is reasonable to believe that oil abounds in quantity sufficient to supply all the demands of navigation. There is much reason to believe that, considering the inferior quality of the coal found on this coast, and the unmistakable indications of an almost inexhaustible supply of petroleum, the latter material must, at an early day, come into use as fuel for making steam. The oil-producing region available for ocean steam navigation in California, extends along the entire length of our sea coast, from the extreme northern to the very southern boundary of our State. In many places the oil-producing strata come down to the shore line, and even dip under the sea at one or two points. Capital and enterprise will soon be brought to bear in developing this new source of our mineral wealth. We have now nothing to say of the immense deposits which will ultimately be found in the interior.

It is too late, in the presence of existing facts and developments, to tell us that "the introduction of petroleum as fuel is one of the wildest dreams that was ever conceived." That idea was urged, with perhaps some show of reason, a few years since, when it was believed that the supply of this product was limited, and that all that could be obtained would be needed for illuminating purposes, and would find a ready market at high prices. But now, when its product is already promising to exceed that of coal, and when its existence is believed to be so universal and so abundant that its *price* must soon become no barrier to its proposed new application, we can no longer regard its ultimate use for navigation purposes as at all problematical. Capitalists and inventors are now beginning to turn their attention seriously to this matter. They are taking enlarged views of the premises, and people, who rejoice in every new evidence of commercial progress, may rest assured that, however large and impossible such views may now seem, the problem of the proposed radical change in ocean steam navigation will soon be solved. The genius and enterprise of the American people, who years ago revolutionized the peaceful operations of commercial intercourse, and more recently have wrought an equally important revolution in the war marine of nations, will not be found hesitating upon the threshold of so important and desirable a change as is now contemplated in the same field of enterprise.

In the experiments thus far reported, it would appear that there has been a waste of nearly or quite one-half the oil from imperfect arrangements for combustion. All that now remains to be done is to devise some plan for its use by which its combustion shall be made as perfect as that of coal in the present most improved form of grates. There certainly cannot be anything like the obstacles in the way of such an accomplishment as were encountered in the substitution of coal for wood, and we hesitate not to express the opinion that not half the time will elapse in effecting this change as was occupied in the former one.

It is to petroleum that we are to look for the full and complete development of the application of steam upon the ocean. We can reasonably anticipate no further change in that direction, unless the genius of man shall introduce an entirely new motive power, which shall completely supercede this great agent of modern progress. It certainly appears that petroleum is the fittest and most appropriate fuel for steam on the great and open sea. With a fuel so compact and requiring so little handling, ships could make the longest passages direct, without stopping for calms, or turning aside to renew their supply of fuel. No army of stokers would be required, no waste of fuel would be made in the heavy volumes of smoke constantly rolling out from the stack. The huge coal bunkers, which now occupy so large a portion of ship room could be mainly applied to the storage of merchandize. An immensity of time and labor would be saved, either more expensive than the most costly fuel; and, finally, no part of the world would be more greatly benefited by such a change than California, and no ocean highways so much improved as those traversing the immensity of the Pacific.

APPLICATIONS OF MAGNESIUM.—This metal was obtained from its earth, by means of the voltaic battery, by Sir Humphrey Davy, in the year 1807. It remained little else than a chemical curiosity, until 1862–3, when Mr. Edward Sonstadt patented a series of processes whereby it may now be produced in any quantity. Magnesium is a metal white as silver, and very light, its specific gravity being 1.74, or about one-fifth the weight of copper. In the form of wire it may be purchased at about six cents per foot, of all the principal metallurgists, opticians, and photographists' material dealers in the eastern cities. If the end of a piece of the wire be held in the flame of a candle, it at once takes fire and burns gently, with a dazzling white light, by which a photograph may be taken with a perfection equal to sunshine. A lamp has been constructed with a view of employing the wire for illuminating purposes. The metal is also exceedingly valuable for chemical processes in the laboratory.

FOUL AIR EXPLOSION.—A singular accident occured at the corner of Montgomery and Pacific streets, in this city, at the time of the political celebration on Saturday evening last. Some boys had started a bonfire of tar-barrels immediately over the fire cistern located there, and while in the act of piling on the fuel, an explosion occured under their feet, throwing, it is supposed all the little patriots on to firm ground, while the whole covering of the cistern suddenly disappeared leaving in its place a great hole, some twenty feet in diameter. It was a most providential circumstance that none of the youngsters were killed. The accident was doubtless caused by an explosion of carboretted hydrogen gas—the "fire-damp" of miners—which had formed in the cistern. The fire upon the surface produced an upward current which brought the gas in contact with the fire and hence the explosion.

A NEW LOCOMOTIVE.—The Nevada *Gazette* says that Mr. L. Shankland, of Montezuma Hill, in Nevada county, has just completed a working model of a new locomotive which he claims will drive a train of cars up an incline of 1000 feet to the mile. Mr. Shankland has been at work upon the machine for several years and has just brought it to perfection.

AGRICULTURE feeds us; to a great degree it clothes as; without it we could not have manufactures, and we should not have commerce. They all stand together like pillars in a cluster, the largest in the centre, and that largest is agriculture.

NEW WATER MILL.—Cole & Co, have just started their new water mill on the Carson river. It started with five stamps, but is designed for ten.

TOBACCO IN OREGON.—Those in Oregon who have attempted to raise tobacco the past season have been very successful. With proper care in curing, it will become the most valuable crop grown in the State, but it will require another year to cure it.

A young bride of eighteen, in Marseilles, was burned to death on the morning of her marriage by treading on a match, which ignited and set her clothes on fire.

S. F. Mechanics' Fair Reports.

COMMITTEE REPORTS

OF THE SAN FRANCISCO MECHANICS' INSTITUTE INDUSTRIAL EXHIBITION OF 1864.

[By authority of the Executive Committee for the management of the Fourth Industrial Exhibition of the Mechanics' Institute, we shall continue, under this heading, until completed, the publication of the Reports and Awards of the Examining Committees in the various departments of the Exhibition, as received by the Managers to accord with the rules governing the distribution of awards. Where the reports have not been made in form prepared for publication abstracts or digests only will be given. The Managers desire it stated that, while articles originating and manufactured abroad contributed in a degree to the variety and interest of the exhibition, which in return afforded their merits opportunities of becoming widely known, to the advantage of those showing them, the enterprise was intended to be an exposition of the material and industrial resources of this State, and the adjacent Territories, to which the honorary awards must be limited. Believing, too, that the distribution of premiums of several grades among competitors has a greater tendency to produce jealousy and dissatisfaction than to encourage enterprise and efforts for excellence, the Executive Board has determined to allow no second, third, or other inferior grade of Premiums.]

Class XIV.

Lumber, Scrolling, Turning, Etc.

COMMITTEE:

WM. PATTON, C. W. DAVIS, C. L. TAYLOR,
W. H. EASTMAN, J. WARREN.

Report:

NATHANIEL PAGE & Co., of the Union Lumber Yard, exhibit specimens of Sugar Pine from the mills of the Union Lumber Co., of Marysville. Said lumber varies from one inch to three inches in thickness, is four feet wide and from twelve to sixteen feet long. This description of lumber is extensively used in building, for finish and for the manufacture of doors, sashes, etc., and bids fair to exclude the importation of Eastern pine from this market altogether. The only general purposes which this does not entirely supersede, and for which Eastern pine is now used on this coast, is for patterns for foundry work, but which, even in this department, is being superseded by proper selections and seasoning of sugar pine for the purposes required. Two specimens of sugar pine on exhibition are of the very finest quality, their extraordinary size, closeness of grain and capability of smoothness of finish and durability, freeness from pitch, excellency of manufacture and superior whiteness, class them as equal to any white pine imported and superior to the bulk which comes to this market from the East. The display of matched sugar pine shows a superiority of workmanship and excellency of material. There is about ten million feet of clear sugar pine used in this State annually for the purposes above named, and about one million Eastern pine imported per annum. Five years ago these figures were reversed.

The Mendocino Red Wood exhibited by Messrs. Page & Co., is of the best quality of that material. It is much used in buildings for outside finish and makes a good common finish for joiners' work. It is very durable when properly selected. This lumber is used by carpenters for reasons last mentioned where no great strength is required. The locality whence these specimens are derived is considered to be the best yet discovered in this State. Forty millions superficial feet, lumber measure, are used in the city of San Francisco per annum for building and other purposes. We think the exhibitors are entitled to the highest premium for Lumber.

M. C. DUPUY exhibits a model of a Street House, showing a bressummer or lintel to support the wall over a retail store front. This bressummer is framed of wrought iron, of a form similar to the top and bottom chords and arc of a similar truss bridge, so often used. The principle being correct, there is no reason why this bressummer should not supersede cast iron in many cases for similar purposes. By mathematical calculations its strength would be estimated; but the only sound results should be had by experiments, so as to test its absolute capacity of resistance to transverse pressure. We consider the bressummer of Mr. Dupuy meritorious.

M. E. FITZGIBBONS exhibits pairs of Wharf Piles covered with a silicious solution, applicable as an external coating to prevent the attacks of the "toredo navalis," so destructive in its effects upon all timber constructions within the reach of the ocean within the warm, temperate and torrid zones. The specimens exhibited had been, according to representation, submerged six months, and showed no points of attack of the worm. Another specimen of the same timber, unprepared as above, showed damage by the "toredo." Solutions of silicia have been long used in England, in humid situations, where the effects of sulphurous smoke and other destructive atmospheric influences have caused damage to stone work, as an external application to prevent decay; but this is the first instance of which we have heard of the same having been applied to the protection of piling as above. The effect accomplished may be the hardening of the external surface next to the water, thus preventing the penetration of the worm; and if it will do so six months it may do so six years, with every probability of it being as durable at the end of that time as it was before, provided no external abrasion occurs to destroy the artificial hardened surface. We think the matter worthy of being tested in a more thorough manner as likely to be valuable in its results, it favorable, in the growing city of San Francisco on her temporary wharf improvements.

MR. FITZGIBBONS also exhibits specimens of Asphaltum Sidewalk, of good quality. Asphaltum sidewalks are popular when properly constructed. It does not appear, however, that they can be considered practically effective as thoroughly useful unless they can be made so that the material will not be made to run or become half liquid under ordinary degrees of summer heat of a temperate climate free from refracted heat, where the thermometer may stand 90° or 100° Fahrenheit. Asphaltum is formed of petroleum flowing through rocks, having a dessicating effect upon that material which produces it, and when petroleum is found convenient for commercial purposes, not filtrated as above named, it must be assisted by artificial means, such as boiling, so as to expel, carbonize and oxidize its inherent oil, etc., and the addition of absorbents not assailable or alterable by heat to form asphaltum sidewalks. The process of manufacture nearest attaining these results, whatever the natural state of the mineral, is the most successful. We think Mr. Fitzgibbons has succeeded in producing, by artificial means, in a very great degree of perfection, the results above named in the example before us, and is certainly entitled to an award of merit for his preparation to preserve timber work above named, and also the first Premium for asphalted sidewalk, notwithstanding there were no other competitors.

JOHN NESTER exhibits Brown's Patent Metallic Weather Strips, for doors and windows. We think they will do very well for the purpose intended. Being the subject of a patent, any award of merit on our part would be supererogatory.

PHIL. OTTO exhibits several specimens of Wood Patterns for casting or engraving, very good in workmanship and artistic deserving of honorable mention.

W. ALLEN—Scroll Sawing, of superior workmanship. Worthy of a Premium.

B. H. FREEMAN—Rosewood Vase, of superior workmanship. Worthy of a Premium.

PINKERTON & SHERMAN—Specimen of Machine Cut Picket Fence. There is, in reality, more merit in this product than at first sight would be considered. Its comparative economy of cost with that of turning does not appear, but the producing of forms of polygonal cross section instead of circular, as when turned, opens out a new means of decorative joinery, likely to be cheaply applicable when, as in this case, produced by machinery. We think Messrs. Pinkerton & Sherman are entitled to a diploma of first premium for the above, provided the machinery is of their own invention.

H. S. HUNTINGTON has a sample of very superior Sawed Shingles, which merit honorable mention.

Class XV.

Coopering, Wooden Ware.

COMMITTEE:

A. MUANOCH, WM. GUNN, G. ENGLEHARD.

Report:

The committee appointed to examine the samples of Cooper Work exhibited in competition, find that the large Wine Cask made by J. C. RUPENTHAL entitles him to an award for the best work. Premium.

ARMES, DALLAM & SKINNER exhibit a large variety of Wooden Ware, Tubs and Pails from their manufactory in this city. The manufacture of this indispensable class of wares has become one of our important established industries, and the samples here shown are, in all respects equal to any imported, and should be awarded a Special Premium.

L. VAN LAAK exhibits Brooms of superior quality, entitling them to highly honorable mention.

Class XVI.

Wool and Its Manufactures.

[Reports of this class are continued from last week's issue.]

SUB-DIVISION—Wool Packages.

COMMITTEE:

C. P. LOLOR, A. B. FORBES.

Report:

The undersigned, your committee, have examined specimens of Wool packed for shipment, on exhibition at the Industrial Fair, and beg leave to report:—

Two lots of Packed Wool were exhibited, one lot shown by Messrs. MCLELLAN & GRISSAR, the other by Messrs. CLARK & PERKINS. The bales shown by the first-named firm were loosely packed; iron hoops light, wooden battens narrow, while those by the last-named firm are packed in a very substantial, compact and tightly shape, the iron hoops stout and of good width, the wooden battens broad and well placed, affording great protection to the package in handling.

Wool, forming as it does one of the principal articles of export of our State, it is of great importance that it should be packed for transportation to a distant market in the most compact and substantial manner possible, the advantages gained being a saving in bulk, less susceptibility to damage and a decreased rate of freight. The importance of these points will be readily appreciated by those interested. As the bales exhibited by Messrs. Clark & Perkins possess those advantages, and are altogether in the most desirable shape and condition, doing great credit to the exhibitors, your committee therefore give them the Premium and award.

Respectfully submitted.

COMMITTEE:

C. J. DEMPSTER, JOHN MCALLISTER.

Report:

The undersigned, notified of appointment upon a committee for the examination of Wool and Wool Packages, visited the Exhibition several times, in expectation of meeting other members of the committee, but failing to do so, we do not feel authorized to offer more than an individual report. We found a fine assortment of domestic and foreign Wool. Fleeces and Samples, exhibited by Messrs. CLARK & PERKINS, and the same firm exhibit also samples of classified Wools, baled for shipment. The bales were compact, heavily hooped and battened, leaving nothing in this respect for the carrier to desire; indeed it may be questioned if any party but the carrier finds advantage in this extra heavy style of protecting the bale, as the extra weight adds to the cost of freight, while lighter bands and battens might sufficiently serve the purpose.

Messrs. MCLENNAN & GRISAR exhibited sample bales of Scoured and Graded Wool, well cleaned and assorted. (We cannot, with any confidence, express our opinion as to the success of this recent undertaking of this firm. It can only be determined by experiment and experience whether the scoured wool will carry on sea voyages with as little liability to injury as the wool protected by the natural oil, which is removed with the dirt in scouring.) The bales, though not so tightly packed as when the wool yet retains the grease and dirt, were well pressed and sufficiently secured for all the ordinary hazards of transportation. This firm was the earliest to engage here in the business of classifying and packing wool for shipment, and however the experiment of scouring and grading may result, the enterprise and energy shown deserve approbation.

Class XVII.

[Reports of this class were published in our issue of October 21.]

Minerals and Mineral Products.

COMMITTEE:

H. P. WAKELEE, JOHN N. BISNON, W. T. GARRATT.

Special Report on Process of Reducing Copper Ores.

The undersigned, comprising a committee of three, appointed to examine into and report upon the merits of a new process for the reduction of copper and silver with the "Fusible Hydrous Silicate of Alumina," invented and patented by JAMES T. MCDOUGALL, of the city and county of San Francisco, most respectfully report as follows.—

That your committee, being first satisfied of the patents by inspection of the letters patent and the accompany specifications duly attested, proceeded to examine into the process and its results, by bearing from the Patentee a very lucid explanation of the mode and manner of its working and by actual inspection of samples of reduced metals of a very superior quality, weighing from one-half an ounce to forty pounds, and the examination of various samples in the different stages of reduction. That your committee are perfectly satisfied with the simplicity, economy and perfectness of the process, and in view of its importance and value as an agent and auxiliary, not only to our commerce but to the rapid developments of the mineral resources of this coast, unanimously recommend that the highest premium be awarded to James T. McDougall for the said process.

Your committee have also examined Mrs. ELIZA P. HALL's Patent Volcanic Smelting Furnace for the smelting of ores (a detailed description of which accompanies this report), and it appears to be well adapted to effect an economical and thorough reduction of ores, and is worthy of the inspection of those interested in such processes.

DESCRIPTION.—The design of the Volcanic Smelting Furnace is so to combine ample arrangements for a powerful draft with a condensing apparatus for saving volatile portions of various metals, and a form of furnace most suitable for retaining an intense heat, that a greater economy of fuel and time may be realized, than has heretofore been the case. To this purpose, I adopt the elliptical or egg-shaped form of furnace, and of the blow-pipe on a grand scale. The introduction of the draft is at several different and opposite points, so as to concentrate the same, at once toward the middle of the fire and thus relieve the sides of the furnace of a great proportion of the heat, and intensify the same where it is most wanted; namely, in the mass of ore to be smelted. The melted mass is thus hurried towards the center and sent down, much like an eddy in water. The fire is continued into the interior of the condenser until it reaches half the height of the same, where it is surmounted by a Conical Cap, supported by columns at a sufficient height to allow the fumes to escape into the body of the condenser. The sieve is for the purpose of discharging a continuous shower of cold water into the condenser, by which the volatile metals in the fumes are precipitated to the bottom of the same, and thus saved for reduction.

The opening in the center of the sieve allows the draft to continue from the flue to the outer air. All the fumes are subjected to condensation without any loss of heat in the furnace; indeed, the heat is rather increased by being confined and thrown back by the cold water coming in upon the flue.

The boiler placed on top of the furnace is for the purpose of furnishing steam as an oxidizing agent, both above and below the fire. The jet of steam which is introduced at the bottom becomes super-heated by passing around the inside of the top of the furnace.

The Tuyres or draft-holes may be increased or diminished at pleasure. The draft may be supplied by one or more fan-blowers, worked by any power that is available. Not less than nine Tuyres should be used in a furnace of the capacity of five tons at a charge.

The principal fluxes made use of in this furnace, are limestone, carbonate of soda, salt, carbonate of potash and glass.

The fuel used is exclusively charcoal, of which two bushels are required to one bushel of ore. The ore is to be thoroughly mixed with the charcoal. That fuel is best which contains the most carbon, and thus charcoal, having a great affinity for sulphur, absorbs it from the smelting ore and leaves the metal free.

The fenches or supports forming contractions at the sides near the bottom of the furnace, are the points of greatest heat. It is best to set the draft tubes at an angle of from thirty to thirty-five degrees; first, that the ends of the tubes may not be stopped by the melting mass, and, second, to direct the greatest heat towards the bottom of the furnace in order to prevent the metal from chilling on its way out.

I have received letters patent for 1st. A Combination of parts for the reduction and saving of ores. 2nd. The condenser with the sieve at its top, through which a continuous shower of cold water is kept pouring for the purpose of condensing and precipitating the volatile portions of the metals escaping with the draft. 3rd. The fire cut-off, within the Condenser, and surmounted with the Conical Cap, to secure the condensation and precipitation of the volatile portions of the metals escaping with the draft.

ELIZA J. HALL.

Class XX.

Leather and Its Manufactures.

SUB-DIVISION III—Saddlery, Etc.

COMMITTEE:

W. H. BAXTER, HENRY JUDGE, J. M. JOHNSON.

Report:

MAIN & WINCHESTER exhibit, of their own manufacture, a very great variety of superb Harness, Saddles, Bridles and Martingales, Kersey Horse Dresses, Military Horse Equipments, Whips, Stocks, Lashes, etc., which for elegance of finish and richness of style defy competition with the world. Especial attention is called by your committee to the interest manifested by these gentlemen in contributing to the Exhibition, their productions showing conclusively that we are not behind (but under the circumstances ahead of) our older sister States in this line. Their harness consists of Double Buggy and Carriage, heavy and light; Single Buggy, do. do. Saddles.—Ladies' Quilted Hog and Buckskin best English Style Riding Saddles; Ladies' California Style Riding Saddles; Gents' best English Shafted Riding Saddle; Gents' Best English Rocky Riding Saddle; Gents' Best Texas Ranger and California Saddle. Bridles and Martingales.—Single and Double Rim, Brodoon, Snaffle, Pelham, Post and Race Bridles, with standing martingales to correspond. Kersey Horse Blankets and Dresses.—These goods are of their own manufacture and are most beautiful. The embroidery and style of finish must certainly gratify the most fastidious, the Kersey being made at the Mission Woolen Mills, which heretofore has been imported from England. In the Whip Department, they also exhibit, of their own manufacture, a large stock of Buggy, Carriage and Riding Whips, of assorted patterns and styles, as samples of their products in this line, which are worthy of an extended description. The buggy and carriage whips are of bare whalebone knotted (wrought handles), whalebone covered with cat-gut, with the maker's name elegantly worked in the handle. Some are mounted with silver and gold, from our own California and Washoe mines, and made especially for these goods on exhibition, the handles being of rosewood, malacca, ebony, ivory (plain and roped), mounted with pure silver and gold, elegantly wrought and chased and of various designs, representing dog and horse heads, fawns' feet, gold snakes, etc. The English hunting style of whips are of malacca and whalebone assorted, covered with cat-gut, mounted with massive silver dog and horse heads, hunting boat, etc. The riding whips present even a greater variety than the others, and are wrought in the same rich and varied style of those above described, all being made of whalebone in its natural state, which is far superior to that imported, which are boiled to obtain the oil the bone contains, thus rendering it brittle and much more liable to break. This being the pioneer manufactory in this line of industry, your committee recommend that a special Premium be awarded for these particular goods, and for Saddles and Harness, First Premium.

JOHN WILSON & SON exhibit a magnificent Fire Cap, of their own manufacture, with a pure silver front, with gold letters and figures richly chased and engraved, indicating the number of the company it is intended for. There is on exhibition also an imported cap, a very fine one, but this is superior. Premium.

KRETZ & CASBIE display, of their own manufacture, a fine variety of Concord style of Collars, superior to anything ever made in California, consisting of Stage, Express, Coach, Buggy and Team Collars. Premium.

ALEX. LOGAN exhibits a very fine Patent Leather Collar, of his own make, of a particular style, known as the "Kay" Collar. Premium.

TIBURCIO CARLOS exhibits an elegantly embroidered with silver and gold Mexican Saddle and Trappings, spurs and bits inlaid and chased with silver and gold, hair reins, cinchez, etc., of his own manufacture, exceeding in richness anything exhibited. Premium.

SENOR A. CAMPOS also exhibits a very good Mexican Saddle.

PEET & SON and others exhibit Mexican Saddles.

SUB-DIVISION I—Boots and Shoes.

COMMITTEE:

A. SCHUMACHER, WM. LUNSDEN, FRANCIS WORTH,
J. L. WILLCUTT, J. G. HEIN.

Report:

All the goods in this department of the Exhibition were of fine quality and workmanlike finish, and the committee, after careful inspection, report the following awards:—

GEORGE BURKHARDT, for the best Light Boots (Men's), Premium.

OBERMEYER & RAPPOLD, Men's Heavy Boots. Honorable mention.

THOMAS DOLLIVER, Ladies' Gaiters and Childrens' Shoes. Premium.

PETER DORN, Men's Riding Boot-Legs. Premium.

GEO. K. PORTER is entitled to a special Premium for six sample cases of common quality Boots and Shoes, which will compare favorably with imported goods of the class, and afford promise of success in this new branch of our home manufactures.

SUB-DIVISION II—Fire Hose, Leather Belting.

COMMITTEE:

E. A. WILSON, F. E. R. WHITNEY.

Report:

The committee report that there were two exhibitors of Fire Hose—M. N. COOK and H. MILLER. Each had samples of two classes of Hose—double and single riveted. They were tested by coupling two lengths of the same class, one of each maker's, with a blind butt on the end, and attaching the hose to Stoddart's steam pump. Mr. Miller's double riveted hose burst with a pressure of 170 pounds. The single-riveted hose was then tested in the same manner, Mr. Cook's bursting with a pressure of 165 pounds. This test was so decidedly fair that the committee have no hesitation in recommending a Premium to Mr. COOK, for A 1 Double-Riveted Hose, and to Mr. MILLER a Premium for A 1 Single Riveted Hose, and regret that there was no Eastern-made hose in competition, as the test was unusually severe, and we have no hesitation in saying (if within our province) that the necessity does not exist for our own corporation, or others in the State, to import in this line to the injury of our own mechanics.

HENRY MILLER is the only exhibitor of Belting, and the samples shown are fully equal, if not superior, to any of Eastern manufacture. The large double belting used for driving the machinery at the Exhibition was furnished by Mr. Miller, and though no competition was made in this line, we regard Mr. Miller entitled to a Premium for excellence in this important branch of manufacture.

WM. VEEZ exhibits several sections of Section Hose and Leather Blunderbuss, which are entitled to most honorable mention.

SUB-DIVISION IV—Trunks, Valises, Traveling Bags.

COMMITTEE:

JOHN FITZPATRICK, E. A. HUDER, E. DOWLING.

Report:
